Diaphragm accumulator

Type HAD

HADO,7-210_d

- ▶ Component series 1X and 2X
- ▶ Nominal volume 0.075 ... 3.5 liters
- ▶ Maximum operating pressure 350 bar

CE

EAC

Features

- ▶ Hydro-pneumatic accumulator for use in mobile machines and stationary machinery and systems
- ▶ Use:
 - Energy storage in intermittent operation systems
 - Energy reserve for emergencies
 - Impact and vibration absorption
 - Volume compensation in case of pressure and temperature change
- ▶ Approval:
 - according to PED 2014/68/EU
 - according to TR CU 032/2013

Function, section

General

One of the main tasks of hydro-pneumatic accumulators is e.g. to accept certain volumes of pressurized liquids of hydro-pneumatic installations and to return them to the system if required.

As the liquid is pressurized, the hydro-pneumatic accumulators are treated like pressure vessel and must be designed for the max. operating over-pressure considering the acceptance standards of the country of installation.

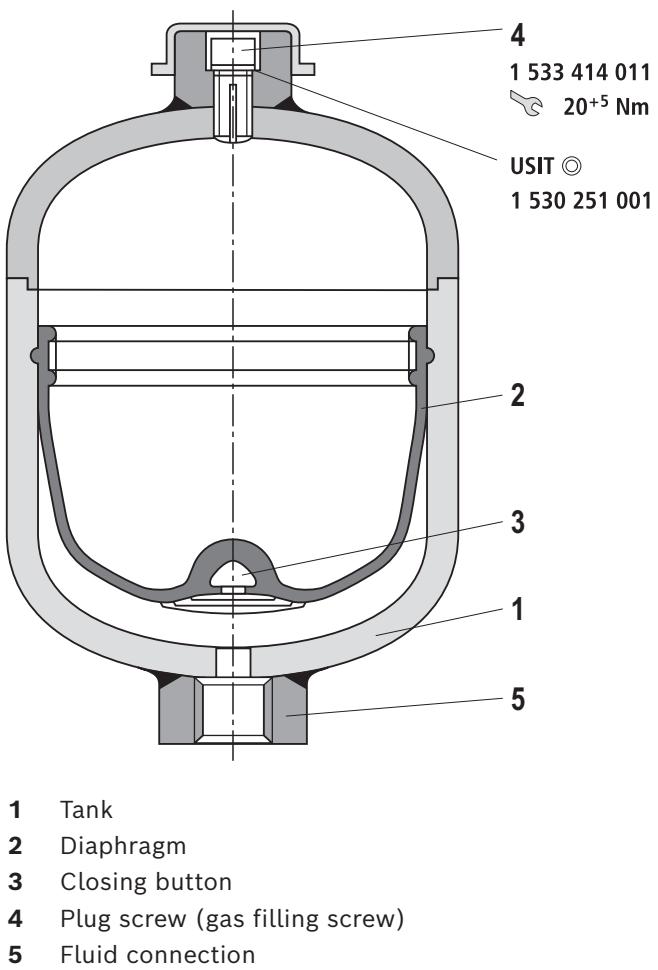

In most hydro-pneumatic systems, hydro-pneumatic accumulators with separator element are used.

The difference between bladder, piston and diaphragm accumulators lies in the type of separator element.

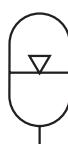

Hydro-pneumatic accumulators essentially consist of a fluid section and a gas section with a gas-tight separator element. The fluid section has a connection to the hydraulic circuit. During the pressure increase, the gas is compressed and liquid accepted in the hydro-pneumatic accumulator. When the pressure decreases, the compressed gas expands and displaces the accumulated fluid into the circuit.

Diaphragm accumulator

Diaphragm accumulators consist of a pressure-resistant steel vessel (1) which most commonly has a spherical to cylindrical form. Inside the accumulator, there is the separator element, namely a diaphragm (2) made of an elastic, flexible material (elastomer) with the closing button (3) and the plug screw (4). They correspond to Pressure Equipment Directive 2014/68/EU.

Application, mode of operation

Applications

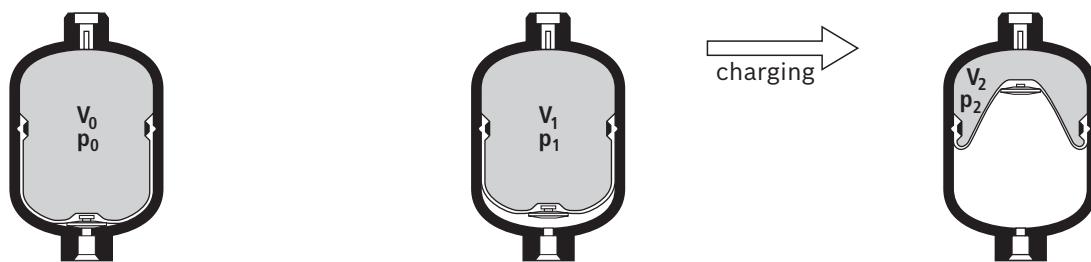

Various applications exist for hydro-pneumatic accumulators:

- ▶ Energy storage in order to save pump drive power in intermittent operation systems.
- ▶ Energy reserve for emergencies, e.g. upon failure of the hydraulic pump.
- ▶ Compensation of leakage losses.
- ▶ Impact and vibration absorption in case of periodic vibrations.
- ▶ Volume compensation in case of pressure and temperature changes.
- ▶ Suspension element for vehicles.
- ▶ Shock absorption with mechanical shocks.

Mode of operation

Fluids are almost incompressible and therefore cannot store pressure energy. Hydro-pneumatic accumulators use the compressibility of a gas for fluid storage. The nitrogen used must at least comply with cleanliness class 4.0:

N₂ 99.99 vol.%

Calculation

Pressures

For calculation of an accumulator, the following pressures play a respective role:

p_0 = Preset gas pressure
at room temperature and drained
fluid chamber

p_{0T} = Preset gas pressure
at operating temperature

p_1 = Minimum operating over-pressure

p_2 = Maximum operating over-pressure

t_{max} = Maximum operating temperature

The life cycle of the diaphragm is the higher the smaller the difference between p_1 and p_2 is. However, the operating ratio of the maximum accumulator capacity will also be reduced accordingly.

Diaphragm accumulator

$$p_2 \leq 4 \cdot p_0 \quad (2)$$

On request

$$p_2 \leq 8 \cdot p_0$$

In order to achieve the best utilization of the accumulator volume possible as well as a long life cycle, compliance with the following values is recommended:

$$p_0, t_{max} \approx 0.9 p_1 \quad (1)$$

The highest hydraulic pressure should not exceed four times the filling pressure, as otherwise too much stress will be put on the elasticity of the diaphragm, resulting in too great a compression change with strong gas heating.

Notice:

To achieve an increased pressure ratio ($p_0 : p_2 > 1 : 4$) in the accumulator, a filler can be installed on the gas side of the accumulator.

This way, the usable gas volume V_1 is decreased while the diaphragm is protected against inadmissible deformation.

Calculation

Oil volume

According to the pressures $p_0 \dots p_2$, the gas volumes $V_0 \dots V_2$ will result.

In this process, V_0 simultaneously is the nominal volume of the accumulator.

The available oil volume ΔV corresponds to the difference of the gas volumes V_1 and V_2 :

$$\Delta V \leq V_1 - V_2$$

The gas volume variable within a pressure differential is determined by the following equations:

- For an **isothermal state change of gases**, i.e. when the change of the gas cushion happens so slowly as to leave sufficient time for a complete heat exchange between the nitrogen and its environment, therefore keeping the temperature constant, the following applies:

$$p_0 \cdot V_0 = p_1 \cdot V_1 = p_2 \cdot V_2 \quad (4.1)$$

- For an **adiabatic state change**, i.e. a quick change of the gas cushion accompanied by a temperature change of the nitrogen, the following applies:

$$p_0 \cdot V^{\gamma_0} = p_1 \cdot V^{\gamma_1} = p_2 \cdot V^{\gamma_2} \quad (4.2)$$

γ = Ratio of the specific gas heats (adiabatic exponent), for nitrogen = 1.4

In practice, state changes rather follow adiabatic laws. Often charging is isothermal and discharge is adiabatic.

Considering the equations (1) and (2), ΔV is between 50% and 70% of the nominal accumulator volume. The following applies as a guiding principle:

$$V_0 = 1.5 \dots 3 \times \Delta V \quad (5)$$

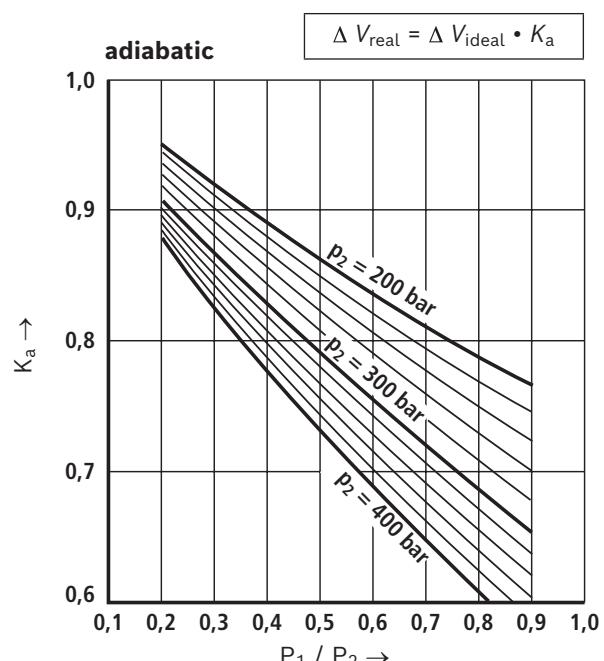

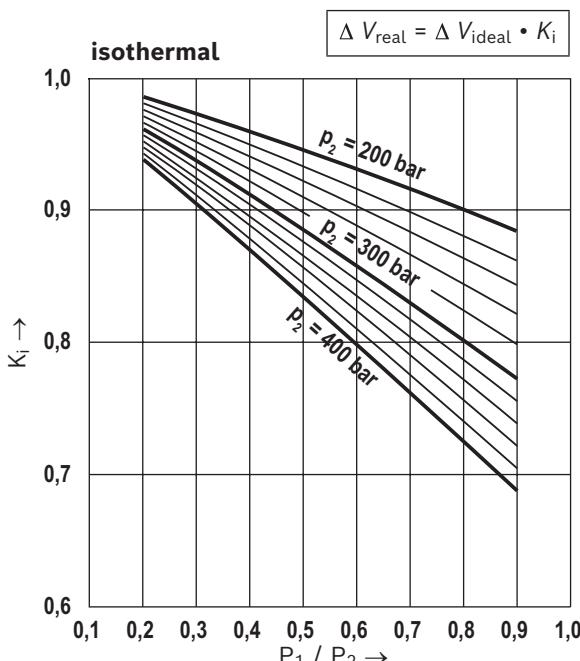

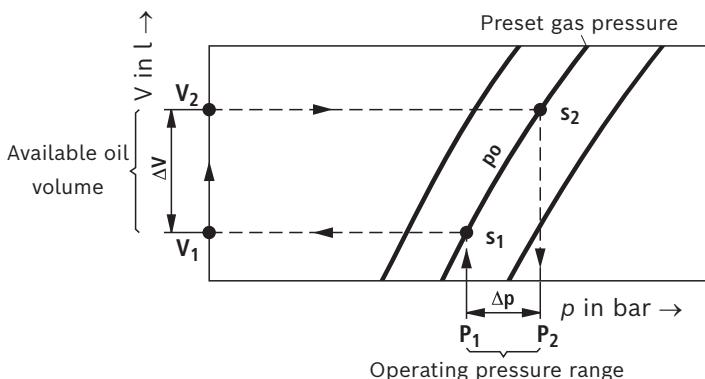

Calculation diagram

For graphic determination, the formulas (4.1) and (4.2) are converted into diagrams on pages 9 and 10. Depending on the task, the available oil volume, the accumulator size or the pressures can be determined.

Correction factor K_i and K_a

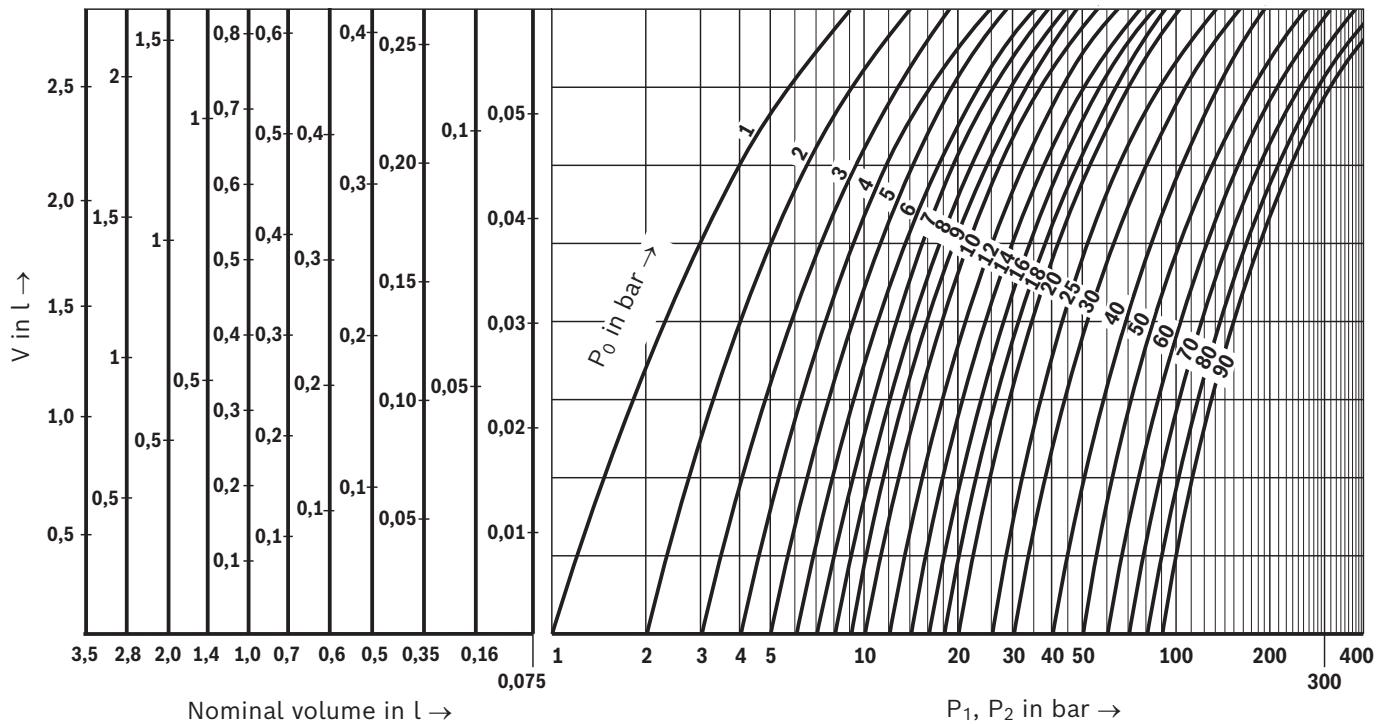

The equations (4.1) and (4.2) apply to ideal gases only. The behavior of real gases, however, will show considerable variation at operating pressures above 200 bar which will have to be accounted for by correction factors. These can be taken from the following diagrams. The correction factors the ideal sampling volume ΔV is to be multiplied with lie within a range of 0.6 ... 1.

Application of calculation diagrams

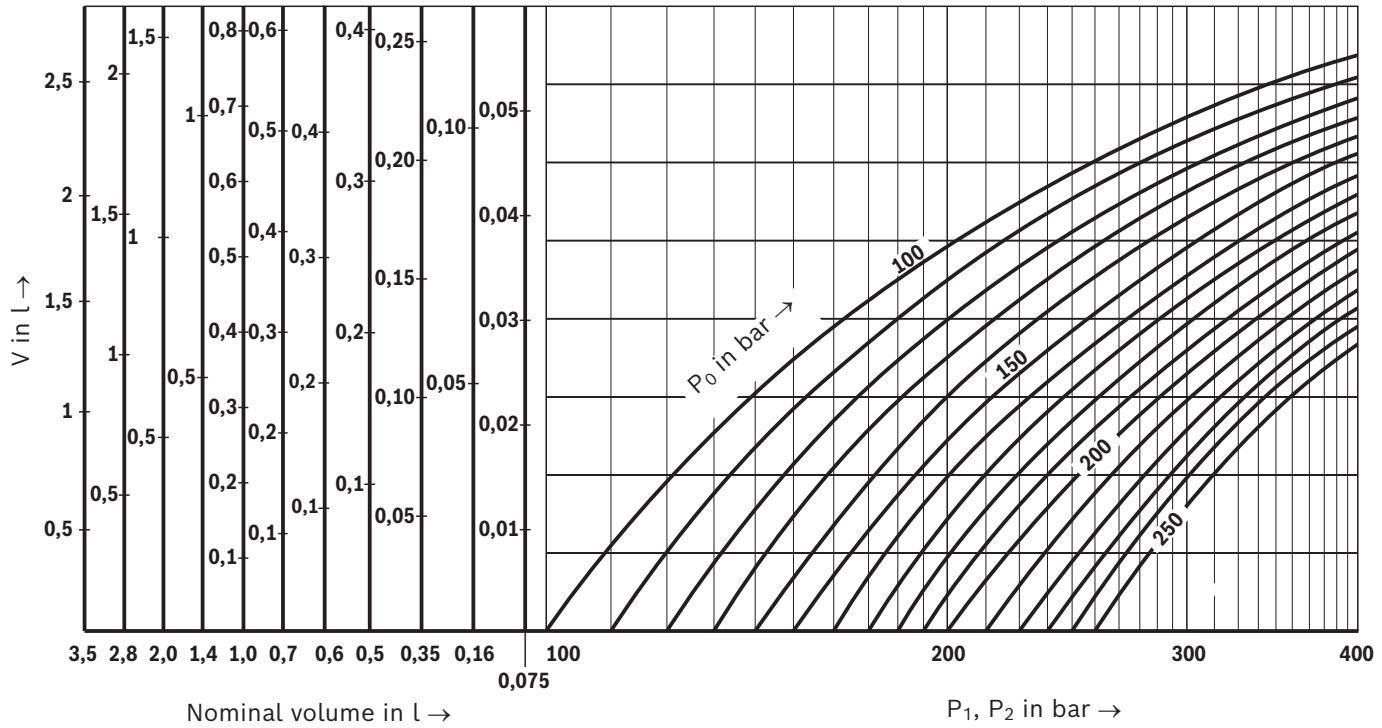

Characteristic curves

Isothermal state changes $p_0 = 1$ to 90 bar

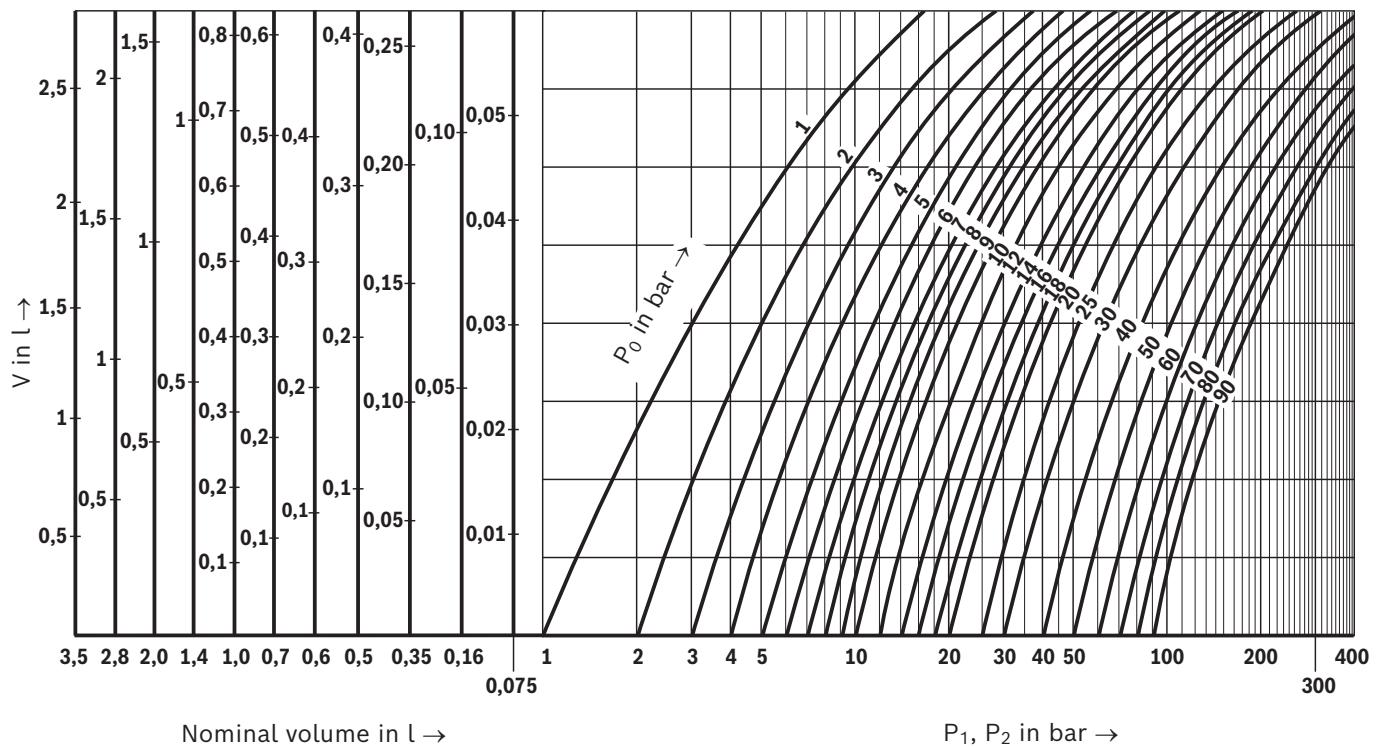

Isothermal state changes $p_0 = 100$ to 250 bar

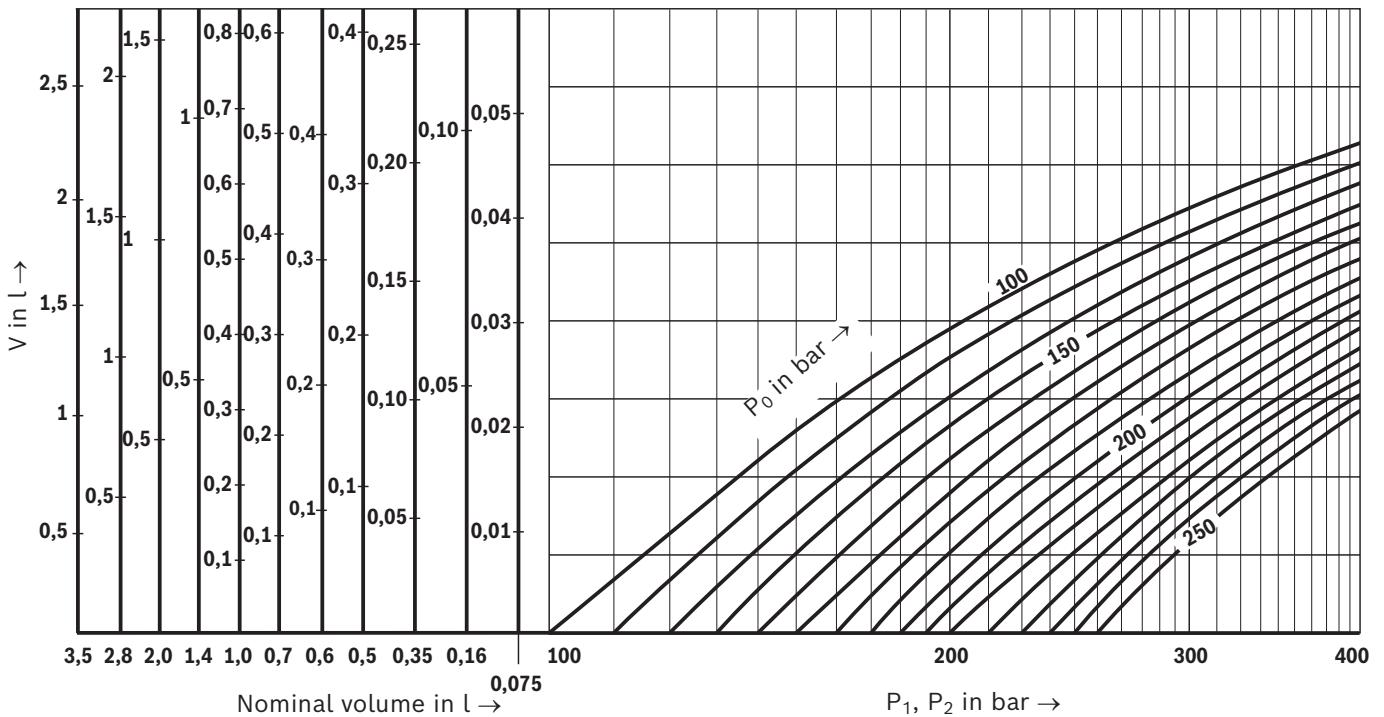

Characteristic curves

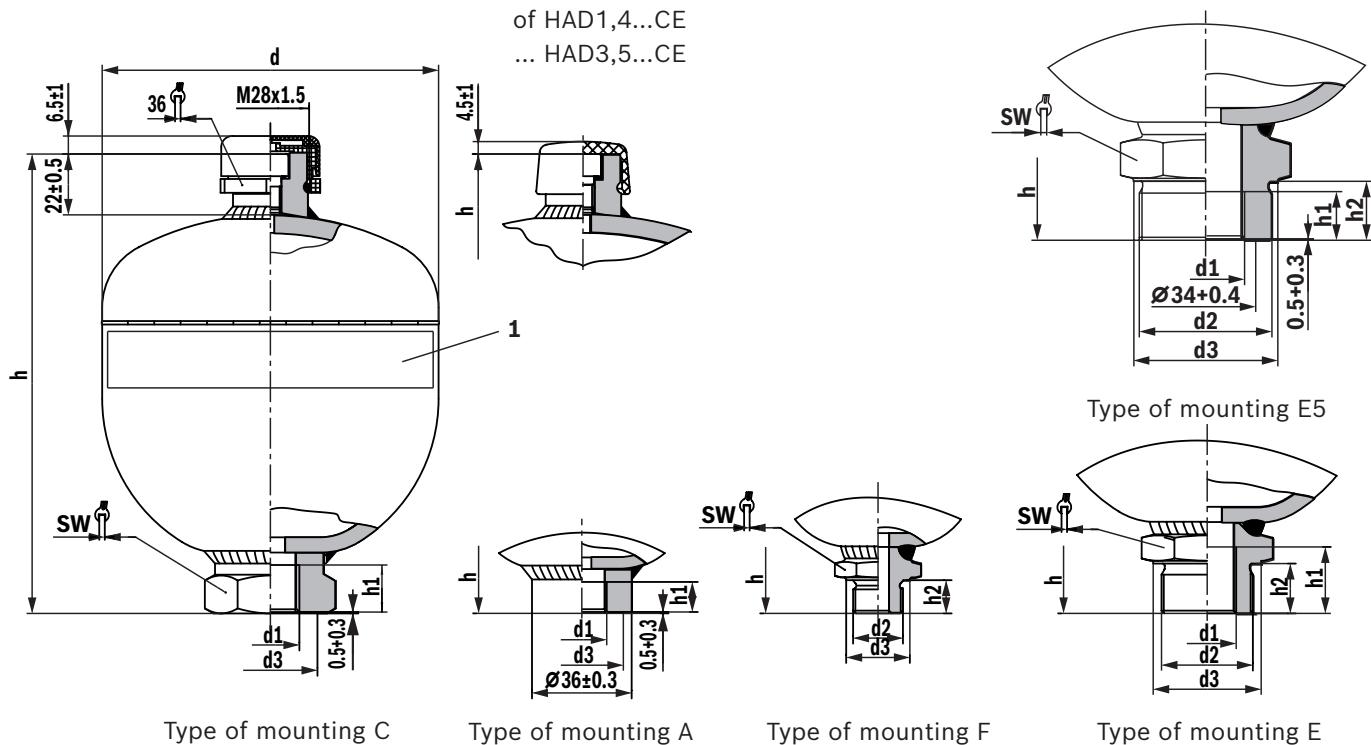

Adiabatic state changes $p_0 = 1$ to 90 bar

Adiabatic state changes $p_0 = 100$ to 250 bar

Important notices

Intended use

Rexroth diaphragm accumulators type HAD..-1X/2X are intended for the set-up of hydraulic drive systems in stationary mechanical engineering and plant construction. In mobile applications or applications in which acceleration forces are applied to the diaphragm accumulator during intended use, its use is permitted only following release by the competent Rexroth product manager. Please contact technical sales for this.

Rexroth diaphragm accumulators type HAD..-1X/2X are not intended for private use.

Project planning information

Diaphragm accumulators have to be safely and permanently fastened to the machine or system using mounting elements. The fastening is intended to keep the oil port tension-free. Particularly, no tension forces or static or dynamic inertia forces should be applied to the oil port. Thermal expansion of the supporting structure and vibrations originating from the environment should be considered in the selection of suitable mounting points.

Safety instructions for hydro-pneumatic accumulators

The machine end-user is required to enclose operating instructions RE 50150-B for the machine or system and the CE Declaration of Conformity for containers > 1 liters. General information for hydro-pneumatic accumulators in hydraulic system can be found in DIN EN ISO 4413. Keep all documents included in the delivery in a safe place. They will be required by the expert in recurring tests.

Safety equipment

Notice:

Hydro-pneumatic accumulators have to be secured against operation outside of the admissible limits according to Pressure Equipment Directive 2014/68/EU.

Legal provisions

Hydro-pneumatic accumulators are pressure vessels and subject to the application national provisions and/or regulations valid at the place of installation.

In Germany, the Ordinance on Industrial Safety and Health (BetrSichV) applies.

In special applications, additional regulations for shipbuilding, aircraft construction or mining may apply.

Authorized persons

According to Ordinance on Industrial Safety and Health (BetrSichV), only authorized persons may carry out tests. Authorized persons are such persons having obtained the required expert knowledge through professional training, experience and recent professional activity.

In order not to exceed the maximum operating pressure, Bosch Rexroth recommends the use of an accumulator shut-off block type ABZSS according to data sheet 50131.

Commissioning

Installation conditions

Charging pressure

Diaphragm accumulators are usually delivered in condition ready for operation. The charging pressure (p_0) is engraved on the accumulator housing.

Charging gas

Hydro-pneumatic accumulators must only be filled with nitrogen of class 4.0, pure N₂ content of 99.99 vol.%.

Admissible operating temperature

In "standard version", Rexroth hydro-pneumatic accumulators are suitable for operating temperatures of -15...+80 °C.

For deviating temperatures, please contact Bosch Rexroth.

Installation position

Diaphragm accumulators may be installed in any installation position.

Above the gas valve, an installation space of 200 mm must be provided for the charging and test device.

Mounting

When mounting the accumulator, make sure that possible forces, such as the ones created by vibrations or acceleration specific for that application, are absorbed safely. When using several mounting points, avoid stress caused by operational, elastic deformations or temperature expansions.

Bosch Rexroth offers corresponding mounting clamps (see page 14).

Further information

Operating instructions in different languages and declarations of conformity for tank sizes of 1.4 to 3.5 liters are included in the scope of delivery of the product.

Function, section

General information

Hydro-pneumatic accumulators are hydrostatic devices capable of storing a certain amount of energy in order to release it to the hydraulic system when needed.

Fluids only possess low compressibility; however, gases are highly compressible. The working principle of all gas-loaded hydro-pneumatic accumulators is based on this difference.

The difference between bladder and diaphragm type accumulators lies in the type of separator element.

Hydro-pneumatic accumulators essentially consist of a fluid section and a gas section with a gas-tight separator element. The fluid section has a connection to the hydraulic circuit.

If a higher liquid pressure is applied to a specific quantity of pressurized gas, the gas volume decreases as the liquid pressure increases, with the gas pressure increasing with the liquid pressure.

If the pressure of the fluid decreases, the fluid is pushed back into the hydraulic system by the expanding gas until the pressure is balanced again.

Bladder-type accumulator

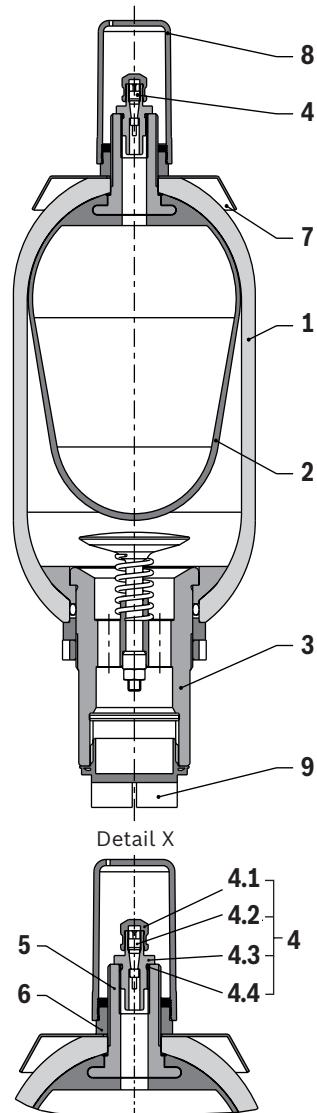

Bladder-type accumulators consist of a seamless cylindrical pressure container (1) made of high-strength steel.

An elastic bladder (2) mounted inside the container separates the accumulator into a gas side and a fluid side. Via the gas valve (4), the bladder is filled with nitrogen up to the intended gas filling pressure p_0 .

The oil valve (3) located inside the oil port of the bladder-type accumulator closes if the pressure on the gas side is higher compared to the fluid side. This prevents the bladder from entering the oil channel and being destroyed. When the minimum operating pressure is reached, a small fluid volume (approx. 10% of the nominal volume of the hydro-pneumatic accumulator) should remain between the bladder and the oil valve in order to prevent the bladder from hitting the valve during each expansion process.

The gas valve (4) consists of sealing cap (4.1), gas valve insert (4.2), gas prefill valve body (4.3), and O-ring (4.4). These parts can be replaced individually.

The type cap (7) includes the technical data and features of the hydro-pneumatic accumulator.

⁴⁾ Epichlorohydrin rubber

Application, mode of operation

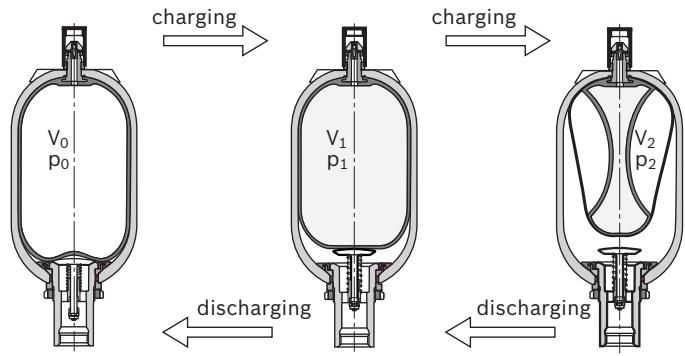

Applications

Various applications exist for hydro-pneumatic accumulators:

- ▶ Energy storage in order to save pump drive power in intermittent operation systems.
- ▶ Energy reserve for emergencies, e.g. upon failure of the hydraulic pump.
- ▶ Compensation of leakage losses.
- ▶ Impact and vibration absorption in case of periodic vibrations.
- ▶ Volume compensation in case of pressure and temperature changes.

Mode of operation

Fluids are almost incompressible and therefore cannot store pressure energy. Hydro-pneumatic accumulators use the compressibility of a gas for fluid storage. Exclusively use nitrogen with a minimum cleanliness class of 4.0! $N_2 = 99.99 \text{ vol.\%}$

Calculation

Pressures

For calculation of an accumulator, the following pressures play a respective role:

p_0	Gas filling pressure at room temperature and drained fluid chamber
$p_0(t)$	Gas filling pressure at operating temperature
$p_0(t_{\max})$	Gas filling pressure at maximum operating temperature
p_1	Minimum operating over pressure
p_2	Maximum operating over pressure

In order to achieve the best utilization of the accumulator volume possible as well as a long life cycle, compliance with the following values is recommended:

$$p_0(t_{\max}) \sim 0.9 \times p_1 \quad (1)$$

The highest hydraulic pressure should not exceed four times the filling pressure, as otherwise too much stress will be put on the elasticity of the bladder, resulting in too great a compression change with strong gas heating:

$$p_2 \leq 4 \times p_0 \quad (2)$$

The life cycle of the accumulator bladder is the higher the smaller the difference between p_1 and p_2 is. However, the operating ratio of the maximum accumulator capacity will also be reduced accordingly.

Calculation

Oil volume

According to the pressures $p_0 \dots p_2$, the gas volumes $V_0 \dots V_2$ will result.

In this process, V_0 simultaneously is the nominal volume of the accumulator.

The available oil volume ΔV corresponds to the difference of the gas volumes V_1 and V_2 :

$$\Delta V \leq V_1 - V_2 \quad (3)$$

The gas volume variable within a pressure differential is determined by the following equations:

- For an isothermal state change of gases, i.e. when the change of the gas cushion happens so slowly as to leave sufficient time for a complete heat exchange between the nitrogen and its environment, therefore keeping the temperature constant, the following applies:

$$p_0 \times V_0 = p_1 \times V_1 = p_2 \times V_2 \quad (4.1)$$

- For an adiabatic state change, i.e. a quick change of the gas cushion accompanied by a temperature change of the nitrogen, the following applies:

$$p_0 \times V_0^x = p_1 \times V_1^x = p_2 \times V_2^x \quad (4.2)$$

χ = ratio of the specific gas heats (adiabatic exponent),
for nitrogen = 1.4

In practice, state changes rather follow adiabatic laws.

Often charging is isothermal and discharge is adiabatic.
Considering the equations (1) and (2), ΔV is between 50% and 70% of the nominal accumulator volume. The following applies as a guiding principle:

$$V_0 = 1.5 \dots 3 \times \Delta V \quad (5)$$

Calculation diagram

For graphic determination, the formulas (4.1) and (4.2) are converted into diagrams on pages 8 and 9.

Depending on the task, the available oil volume, the accumulator size or the pressures can be determined.

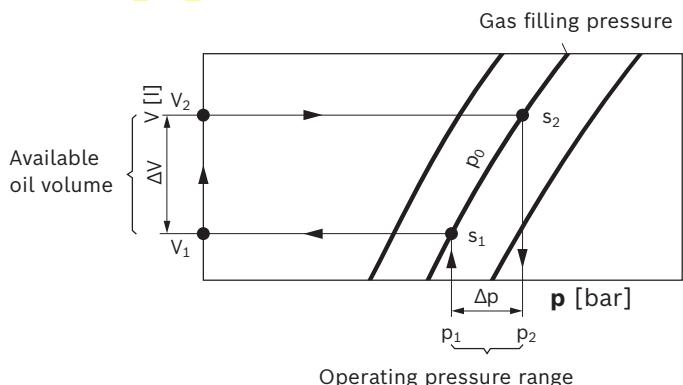

Correction factor K_i and K_a

The equations (4.1) and (4.2) apply to ideal gases only.

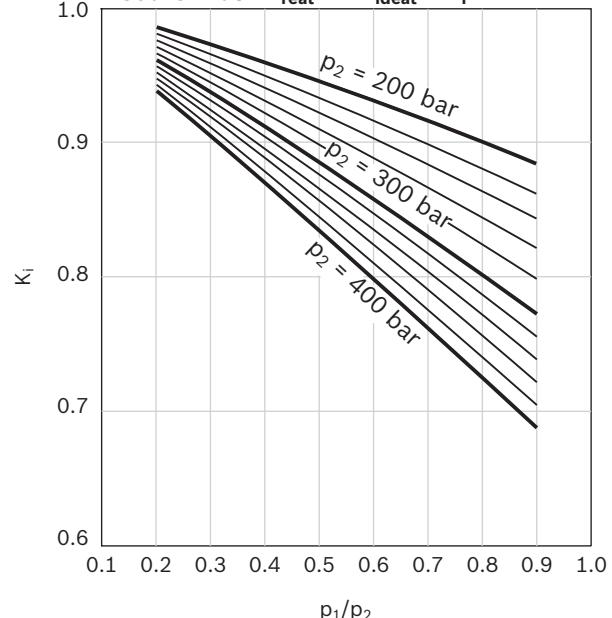

The behavior of real gases, however, will show considerable variation at operating pressures above 200 bar which will have to be accounted for by correction factors. These can be taken from the following diagrams. The correction factors the ideal sampling volume ΔV is to be multiplied with lie within a range of 0.6 ... 1.

Application of calculation diagrams

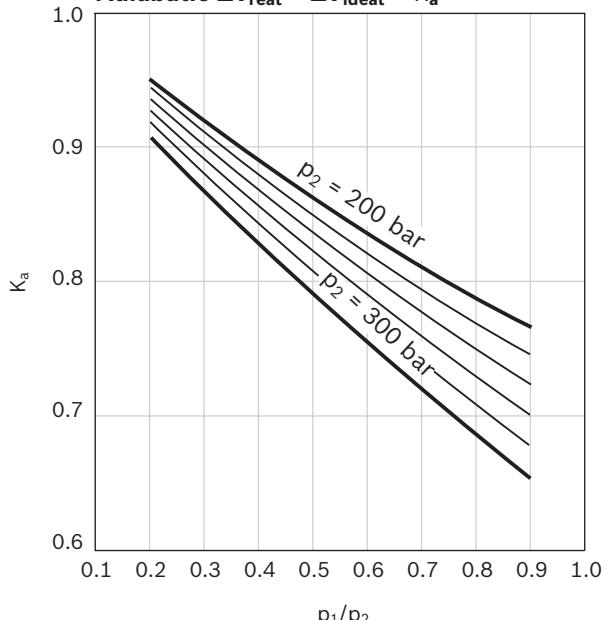

(see page 8 ... 9)

Isothermal $\Delta V_{\text{real}} = \Delta V_{\text{ideal}} \times K_i$

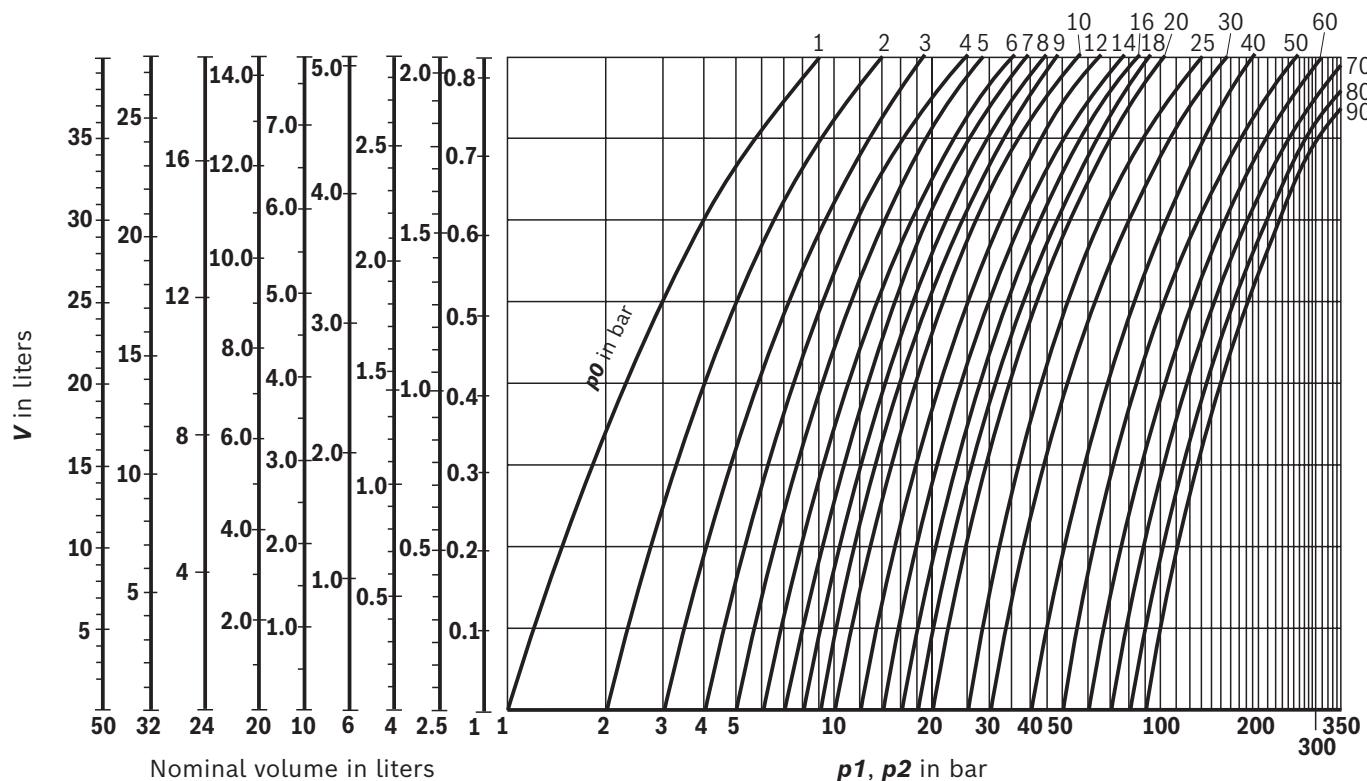

Adiabatic $\Delta V_{\text{real}} = \Delta V_{\text{ideal}} \times K_a$

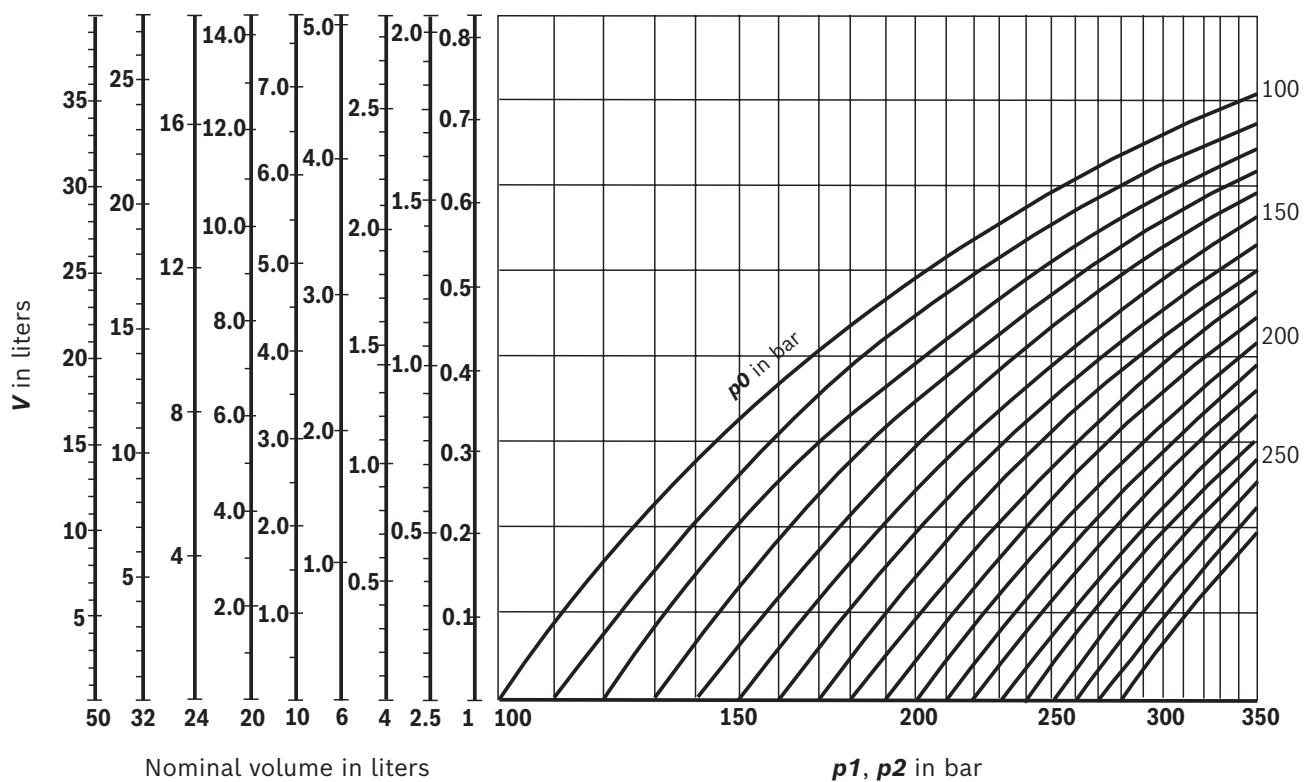

Characteristic curves

Isothermal state changes $p_0 = 1 \dots 90$ bar

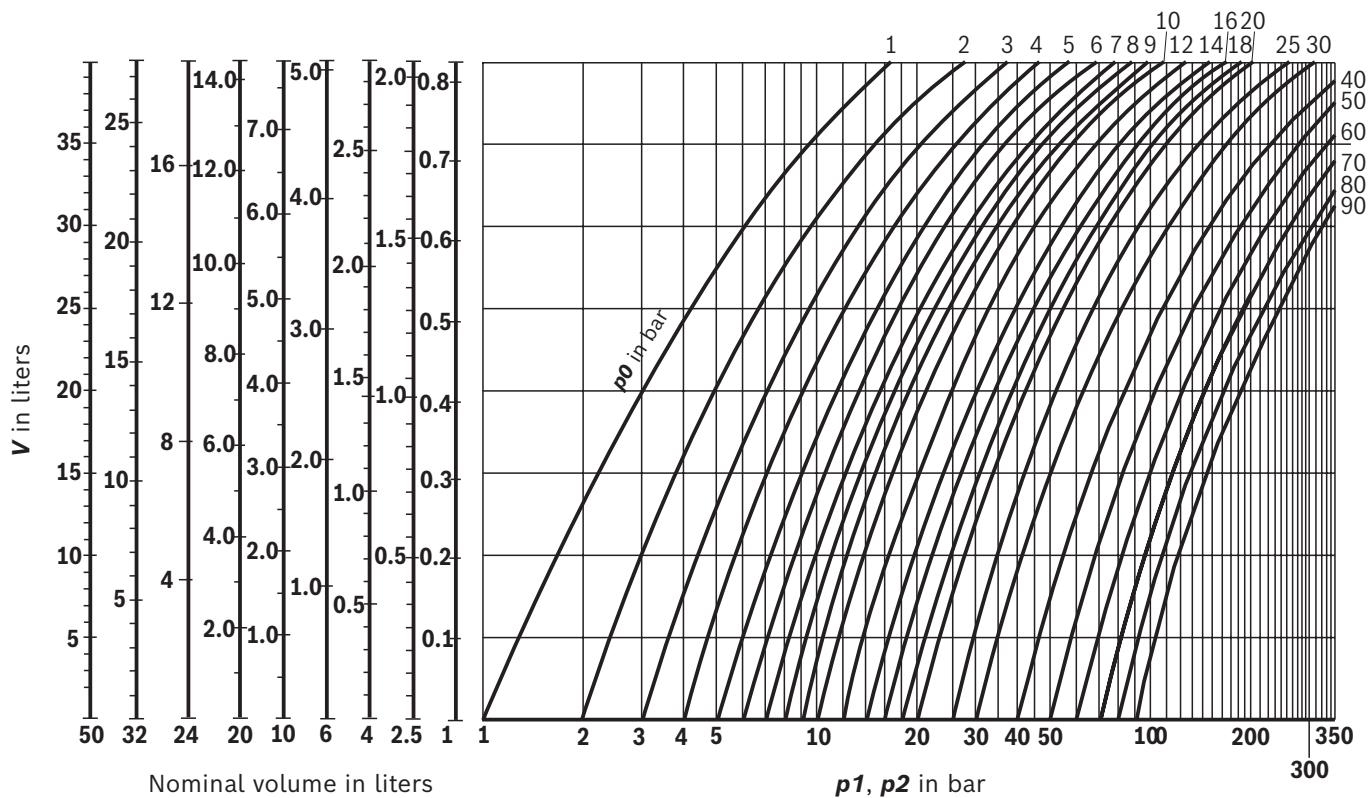

Isothermal state changes $p_0 = 100 \dots 280$ bar

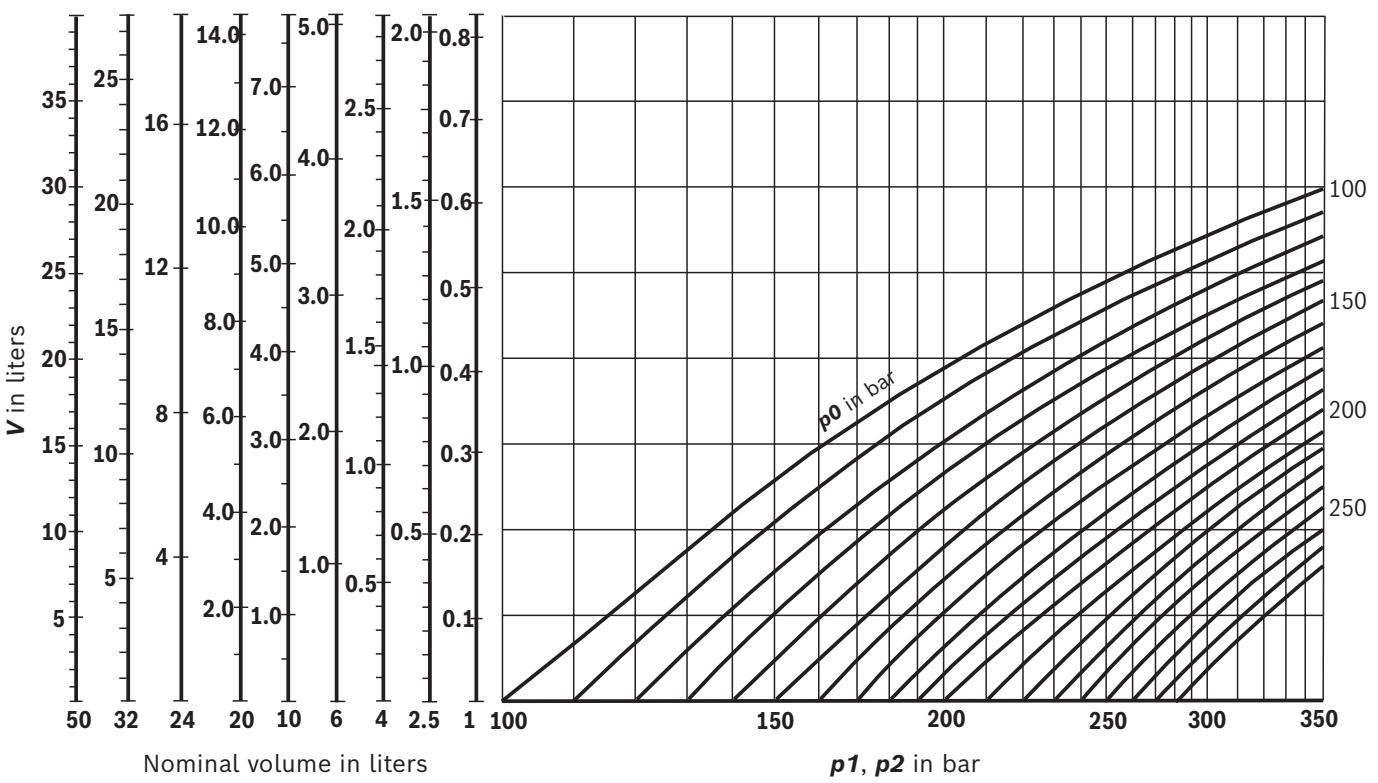

Characteristic curves

Adiabatic state changes $p_0 = 1 \dots 90$ bar

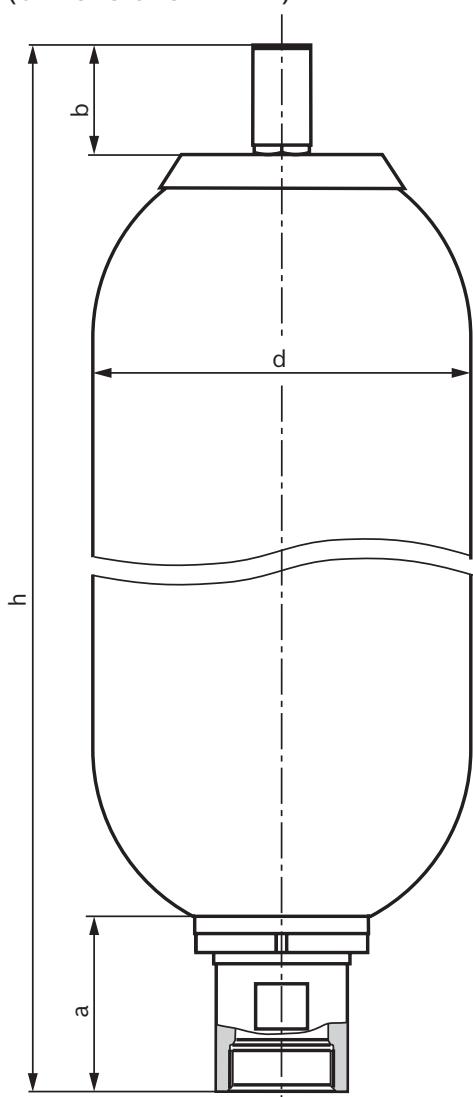

Adiabatic state changes $p_0 = 100 \dots 280$ bar

Important notes

Intended use

Rexroth bladder-type accumulators type HAB..-6X are intended for set-up of hydraulic drive systems in stationary mechanical engineering and plant construction. In mobile applications or applications in which acceleration forces are applied to the bladder-type accumulator during intended use, its use is permitted only following release by the competent Rexroth product manager. Please contact technical sales for this. Rexroth bladder-type accumulators type HAB..-6X are not intended for private use.

Project planning information

Bladder-type accumulators have to be safely and permanently fastened to the machine or system using mounting elements. The fastening is intended to keep the oil port tension-free. Particularly, no tension forces or static or dynamic inertia forces should be applied to the oil port. Thermal expansion of the supporting structure and vibrations originating from the environment should be considered in the selection of suitable mounting points.

Safety instructions for hydraulic accumulators

For bladder-type accumulators type HAB..-6X, operating instructions 50171-B must be observed. The machine end-user will have sole responsibility for complying. General information for hydro-pneumatic accumulators in hydraulic system can be found in ISO 4413.

Keep all documents included in the delivery in a safe place; they will be required by the expert in recurring tests.

Legal provisions

Hydro-pneumatic accumulators are pressure vessels and subject to the application of national provisions and/or regulations valid at the place of installation. In Germany, the Ordinance on Industrial Safety and Health (BetrSichV) applies. Special regulations are to be observed in shipbuilding, aircraft construction, mining, etc.

Authorized persons

According to Ordinance on Industrial Safety and Health (BetrSichV), only authorized persons may carry out tests. Authorized persons are such persons having obtained the required expert knowledge through professional training, experience and recent professional activity.

Safety equipment

Notice:

Hydro-pneumatic accumulators have to be secured against operation outside of the admissible limits according to Pressure Equipment Directive 2014/68/EU.

In order not to exceed the maximum operating pressure, Bosch Rexroth recommends the use of an accumulator shut-off block type ABZSS according to data sheet 50131.

Accumulator	
Design	Diaphragm type accumulator
Installation position	Any, preferably with the fluid connection socket at the bottom
Ambient temperature range	°C -15 ... +65
Line connection	Screw-in thread
Hydraulic fluid	Hydraulic oil according to DIN 51524; other liquids on request
Hydraulic fluid temperature range (others on request)	°C -10 ... +80 (NBR diaphragm) -35 ... +80 (ECO diaphragm)
Acceptance specification for the accumulator	CE/BA China Russia
	Acceptance according to 2014/68/EU or the operating instructions SELO GOST

hydraulic, diaphragm type accumulator							
Nominal volume	V _{rated}	l	0.7	1.4	2.0	2.8	3.5
Effective gas volume	V _{eff}	l	0.75	1.4	1.95	2.7	3.5
Maximum flow	q _{max}	l/min	40	40	60	60	60
Maximum operating pressure	p _{max}	bar	350	350	350	350	350
Max. adm. pressure fluctuation range	Δp _{dyn}	bar	130	130	130	130	130

pneumatic			
Charging gas	Nitrogen, cleanliness class 4.0, N ₂ = 99.99 vol. %		
Gas filling pressure	p ₀	bar	2 (Exception: diaphragm type accumulators with SELO acceptance are not prestressed)

Technical data

Shut-off block			
Seal material			FKM seals (NBR seals on request)
Operating temperature range			°C -15 ... +80
Maximum operating pressure			bar 350
Block material			Steel
Direct operated pressure relief valve			DBDS...K1X/...VB or DBDS...K1X/...E according to data sheet 25402
Cartridge seat valve			KSDER1PB/HN9V according to data sheet 18136-20
Protection class according to VDE 0470-1 – version "K4" (DIN EN 60529), DIN 40050-9			IP 65 with mating connector mounted and locked
Voltage type			V 24 (in case of electro-magnetic unloading "E")
Maximum admissible degree of contamination of the hydraulic fluid; Cleanliness class according to ISO 4406 (c)			Class 20/18/15

Hydraulic fluid	Classification	Suitable sealing materials	Standards
Mineral oils	HL, HLP	NBR, FKM	DIN 51524
Bio-degradable	– insoluble in water	HETG	VDMA 24568
		HEES	
	– soluble in water	HEPG	VDMA 24568

Important information on hydraulic fluids!

- ▶ For more information and data on the use of other hydraulic fluids, please refer to data sheet 90220 or contact us!
- ▶ There may be limitations regarding the technical valve data (temperature, pressure range, life cycle, maintenance intervals, etc.)!
- ▶ The flash point of the hydraulic fluid used must be 40 K higher than the maximum solenoid surface temperature.

- ▶ **Flame-resistant – containing water:** The maximum pressure differential per control edge is 50 bar. Pressure pre-loading at the tank port > 20% of the pressure differential; otherwise, increased cavitation. The pressure peaks should not exceed the maximum operating pressures!
- ▶ **Bio-degradable:** When using bio-degradable hydraulic fluids that are zinc-solving, zinc may accumulate in the fluid (700 mg zinc per pole tube).

Pressure gauge

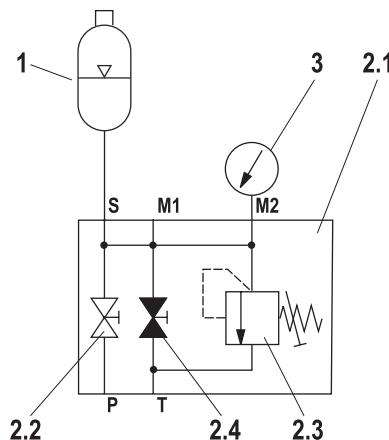

Size	bar	63
Pressure gauge		Glycerin
Double scale		bar/MPa

Surface treatment

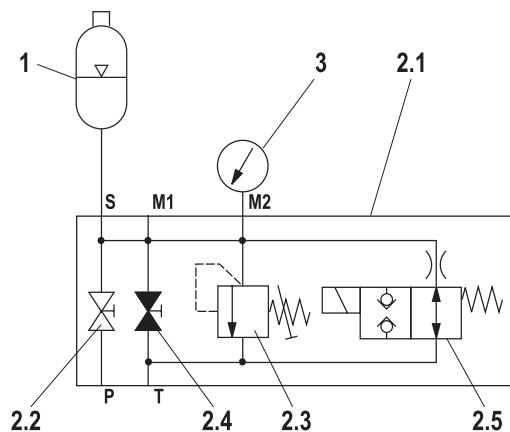

All steel components and components without protective coating are coated prior to installation (minimum corrosion protection time of 12 h in salt spray test). Then, the devices, components and the piping are installed. All components, assemblies, controls, pipes, fittings and standard parts keep the supplied surface protection and are not additionally coated. The corrosion protection is determined by the least protected element in the assembly.

Symbols

Accumulator station with manually operated drain valve

Accumulator station with electro-mechanically operated drain valve

- 1** Hydraulic accumulator
- 2.1** Accumulator shut-off block with:

 - 2.2** System shut-off cock
 - 2.3** Pressure relief valve (type-examination tested)
 - 2.4** Manual unloading
 - 2.5** Electro-magnetic unloading (only version E)

- 3** Pressure gauge with red indication of the maximum admissible operating pressure

Spare parts and accessories

- Diaphragm type accumulator with CE/BA acceptance according to data sheet 50150
- Shut-off block manual/electrical according to data sheet 50131
- Pressure gauge according to data sheet 50205
- Warning sign according to RNI 17506-001

Consoles contained in the assembly kit are intended for mounting by means of screws and nuts or for welding to suitable frames or design components.

Commissioning, maintenance and operating instructions

General Information

- ▶ Observe the documentation for the machinery.
- ▶ Also observe the documentation pertaining to the other components, assemblies and partly completed machinery, which form part of the complete machinery.
- ▶ Observe the generally applicable, legal or otherwise binding European and national regulations as well as the relevant legislation for your country pertaining to the prevention of accidents and protection of the environment.
- ▶ Operating instructions according to data sheet of the accumulator
- ▶ Depending on the country of installation, national pressure vessel regulations need to be complied with.
- ▶ In the standard, the country acceptance is effected according to BA, CE as well as for China and Russia Other acceptances on request.
- ▶ Please indicate the country of installation in the order.
- ▶ Keep all documents included in the delivery in a safe place; they will be required by the expert in recurring tests.
- ▶ The machine end-user will have sole responsibility for complying with existing provisions.
- ▶ The accumulator stations in this edition are assemblies in the sense of directive 2014/68/EU, article 2, section 6 (Pressure Equipment Directive). However, they are not intended for exclusive commissioning. They are installed as a component of a larger assembly or system.
- ▶ The accumulator stations described here contain the entire equipment which is required for safety reasons according to DIN EN ISO 4413.
- ▶ The accumulator stations must not be modified; otherwise, the operating license according to directive 2014/68/EU will be lost and the dealer and/or manufacturer warranty will be forfeited.
- ▶ The accumulator stations may only be operated within the admissible limit values.
- ▶ Repairs may only be carried out by the manufacturer or their authorized dealers and agencies. Repairs performed by third parties invalidate the approval and release the manufacturer from all claims resulting from an unauthorized intervention.
- ▶ Assembly and maintenance must be implemented by authorized, instructed persons only.

Commissioning, maintenance and operating instructions

- The accumulator stations are provided with signs:

 1. **Name plate** specifying the pressure rating, identifies the device
 2. **Functional sign**, identifies the components and elementary lever positions
 3. **Warning sign**, has to be clearly visible and attached at the device or next to it.

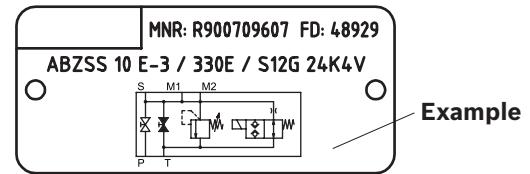

Usually, the warning sign is in the languages according to the country acceptance. Other languages on request.

For hydraulic systems with one or several hydraulic accumulators whose warning signs are not visible after installation into the machine, an additional warning sign has to be attached visibly to the system, stating:

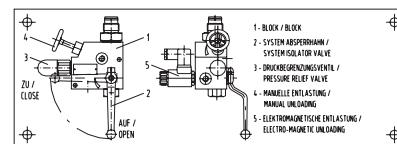

"CAUTION - system contains hydraulic accumulators."

The circuit diagram has to contain the same notice. With mounting "B" and "K", the warning signs and functional signs are supplied loosely and must be attached to or close to the accumulator station in a clearly visible position. The attachment of the signs must already be considered in the design.

Commissioning, maintenance and operating instructions

Commissioning - Operating instructions according to data sheet of the accumulator!

	DANGER
	<p>Do not charge hydraulic accumulators with oxygen or air. Explosion hazard!</p> <ul style="list-style-type: none"> ▶ Prior to the initial commissioning, the hydraulic accumulator must be filled with nitrogen of class 4.0, pure (N2 content 99.99 vol. %). The preset gas pressure necessary for the operation is indicated in the circuit diagrams and operating instructions. ▶ Only use suitable filling and testing devices for filling. We recommend using the charging and test devices by Bosch Rexroth according to data sheet 50150.
	WARNING
	<ul style="list-style-type: none"> ▶ Risk of injury caused by improper assembly. ▶ Hydraulic accumulators are energy stores. They may supply the energy for uncontrolled movements to actuators. ▶ Before beginning any repairs, the system must be depressurized on the oil and gas side and protected against unauthorized re-start. ▶ Do not carry out welding and soldering works or any mechanical processing at the accumulator tank! Any kind of work at the product invalidates the declaration of conformity and the operating license! <ul style="list-style-type: none"> – Explosion hazard due to welding and soldering works! – Danger of bursting during and after mechanical processing. ▶ A warning sign is enclosed to the accumulator station. It is to be attached to or close to the accumulator station in a clearly visible position.

Maintenance

	Attention
	<ul style="list-style-type: none"> ▶ In case of damage at the accumulator bladder or diaphragm, the accumulator will lose its function immediately. ▶ Loss of the initial gas tension will lead to damage at the accumulator bladder or the accumulator diaphragm if operation of the system is continued nevertheless. ▶ Check the initial gas tension in regular intervals.

Legal provisions

- ▶ Hydraulic accumulators are pressure vessels and subject to the application national provisions and/or regulations valid at the place of installation.
- ▶ In Germany, the Ordinance on Industrial Safety and Health (BetrSichV) applies.
- ▶ As a standard, country acceptances are effected according to BA, CE as well as for China and Russia. Other acceptances on request.
- ▶ Special regulations are to be observed in shipbuilding, aircraft construction, mining, etc.
- ▶ Design, production and testing are effected according to the data sheets according to AD 2000. Installation, equipment and operation are controlled by the "Technical rules Pressure vessels" (TRB).

Note pursuant to the EC Machinery Directive 2006/42/EC, according to annex II part 1, section A, manufacturer's declaration:

- ▶ The assemblies were manufactured in accordance with the harmonized standards DIN EN ISO 4413, DIN EN ISO 12100, EN 983, and EN 60204-1.
- ▶ Commissioning is prohibited until it was confirmed that the machine into which the assemblies are to be integrated complies with the regulations laid down in the EC Directives.

Accumulator stations

Type ABSBG

RE 50136

Edition: 2019-01

Replaces: 2016-08

- ▶ Component series 2X
- ▶ With bladder-type accumulator according to data sheet 50171

Features

- ▶ Accumulator station with shut-off block
- ▶ Bladder-type accumulator
- ▶ Shut-off block with integrated shut-off valve, safety valve (type-examination tested) and drain valve
- ▶ Drain valve can be operated manually or electrically
- ▶ Glycerin-filled pressure gauge with red indication of the maximum admissible operating pressure on the dial
- ▶ Console for weld or screw connection
- ▶ Assembly prepared for external equipotential bonding

Design	Bladder-type accumulator										
Installation position	Any, preferably with the fluid connection socket at the bottom										
Ambient temperature range	°C	−15 ... +65									
Line connection	Screw-in thread										
Hydraulic fluid	Hydraulic oil according to DIN 51524; other liquids on request										
Hydraulic fluid temperature range (others upon request)	°C	−15 ... +80 (NBR bladder) −32 ... +80 (ECO bladder)									
Acceptance specification for the accumulator	CE/BA	Acceptance according to 2014/68/EU or the operating instructions									
	China	SELO									
	Russia	EAC									

Hydraulic, bladder-type accumulator											
Nominal volume	V_{rated}	l	1	2.5	4.0	6.0	10	20	24	32	50
Effective gas volume	V_{eff}	l	1.0	2.4	3.7	5.9	9.2	18.1	24.5	33.4	48.7
Maximum flow	q_{max}	l/min	240	450	450	450	900	900	900	900	900
Maximum operating pressure	p_{max}	bar	350	350	350	350	330	330	330	330	330
Max. adm. pressure fluctuation range	Δp_{dyn}	bar	200	200	200	200	125	125	125	125	125

Pneumatic												
Charging gas	Nitrogen, cleanliness class 4.0, $N_2 = 99.99$ vol. %											
Gas filling pressure	p_0	bar	CE, BA, EAC: 0									
	p_0	bar	China: >30 l: 2-5									

Shut-off block											
Seal material	FKM seals (NBR seals on request)										
Operating temperature range	°C −15 ... +80										
Maximum operating pressure	bar 350										
Block material	Steel										
Direct-operated pressure relief valve	DBDS...K1X/...VB or DBDS...K1X/...E according to data sheet 25402										
Cartridge seat valve	KSDER1PB/HN9V according to data sheet 18136-20										
Protection class according to VDE 0470-1 – type "K4" (DIN EN 60529), DIN 40050-9	IP 65 with mating connector mounted and locked										
Voltage type	V	24 (in case of electro-magnetic unloading "E")									
Maximum admissible degree of contamination of the hydraulic fluid	Class 20/18/15										
Cleanliness class according to ISO 4406 (C)											

Hydraulic fluid	Classification	Suitable sealing materials	Standards
Mineral oils	HL, HLP	NBR, FKM	DIN 51524
Bio-degradable	► Insoluble in water	HETG	VDMA 24568
	HEES	FKM	
► Soluble in water	HEPG	FKM	VDMA 24568

Important notices on hydraulic fluids:

- For further information and data on the use of other hydraulic fluids, please refer to data sheet 90220 or contact us!
- There may be limitations regarding the technical valve data (temperature, pressure range, life cycle, maintenance intervals, etc.)!
- The flash point of the hydraulic fluid used must be 40 K higher than the maximum solenoid surface temperature.

► **Flame-resistant – containing water:** The maximum pressure differential per control edge is 50 bar. Pressure pre-loading at the tank port > 20% of the pressure differential; otherwise, increased cavitation. The pressure peaks should not exceed the maximum operating pressures!

► **Bio-degradable:** When using bio-degradable hydraulic fluids that are zinc-solvent, zinc may accumulate in the fluid (700 mg zinc per pole tube).

Technical data

(for applications outside these values, please consult us!)

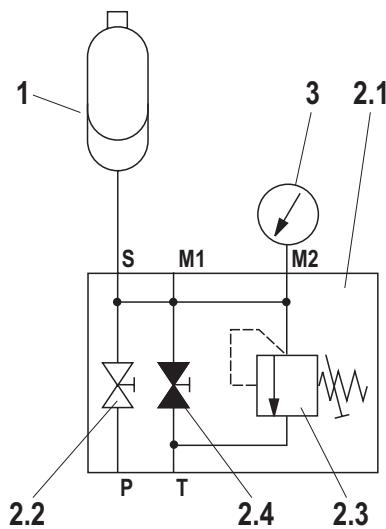

Pressure gauge	
Size	bar 63
Pressure gauge	Glycerin
Double scale	bar/MPa

Surface treatment

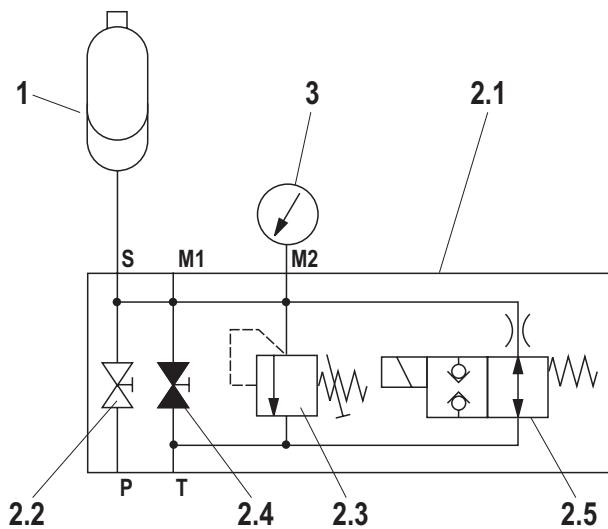

All steel components and components without protective coating are coated prior to installation (minimum corrosion protection time of 12 h in salt spray test). Then, the devices, components and the piping are installed. All components, assemblies, controls, pipes, fittings and standard parts keep the supplied surface protection and are not additionally coated. The corrosion protection is determined by the least protected element in the assembly.

Symbols

Accumulator station with manually operated drain valve

Accumulator station with electro-mechanically operated drain valve

- 1** Hydraulic accumulator
- 2.1** Accumulator shut-off block with:
- 2.2** System shut-off cock
- 2.3** Pressure relief valve (type-examination tested)
- 2.4** Manual unloading
- 2.5** Electro-magnetic unloading (only version E)
- 3** Pressure gauge with red indication of the maximum admissible operating pressure

Spare parts and accessories

- ▶ Bladder-type accumulator according to data sheet 50171
- ▶ Shut-off block manually/electrically according to data sheet 50131
- ▶ Pressure gauge according to data sheet 50205
- ▶ Warning sign according to RNI 17506-001

Consoles contained in the assembly kit are intended for mounting by means of screws and nuts or for welding to suitable frames or design components.

Commissioning, maintenance and operating instructions

General Information

- ▶ Observe the documentation for the machinery.
- ▶ Also observe the documentation pertaining to the other components, assemblies and partly completed machinery, which form part of the complete machinery.
- ▶ Observe the generally applicable, legal or otherwise binding European and national regulations as well as the relevant legislation for your country pertaining to the prevention of accidents and protection of the environment.
- ▶ Operating instructions according to the data sheet of the accumulator
- ▶ Depending on the country of installation, national pressure vessel regulations need to be complied with.
- ▶ In the standard, the country acceptance is effected according to BA, CE as well as for China and Russia. Other acceptances on request.
- ▶ Please indicate the country of installation in the order.
- ▶ Keep all documents included in the delivery in a safe place; they will be required by the expert in recurring tests.
- ▶ The machine end-user will have sole responsibility for complying with existing provisions.
- ▶ The accumulator stations in this edition are assemblies in the sense of directive 2014/68/EU, article 2, section 6 (Pressure Equipment Directive). However, they are not intended for exclusive commissioning. They are installed as a component of a larger assembly or system.
- ▶ The accumulator stations described here contain the entire equipment which is required for safety reasons according to DIN EN ISO 4413.
- ▶ The accumulator stations must not be modified; otherwise, the operating license according to directive 2014/68/EU will be lost and the dealer and/or manufacturer warranty will be forfeited.
- ▶ The accumulator stations may only be operated within the admissible limit values.
- ▶ Repair works may only be carried out by the manufacturer or their authorized dealers and agencies. Repair works performed by third parties invalidate the approval and release the manufacturer from all claims resulting from an unauthorized intervention.
- ▶ Assembly and maintenance must be implemented by authorized, instructed persons only.

Commissioning, maintenance and operating instructions

► The accumulator stations are provided with signs:

1. **Name plate** specifying the pressure rating, identifies the device
2. **Functional sign** identifies the components and elementary lever positions
3. **Warning sign** has to be clearly visible and attached at the device or next to it, however not at the pressure vessel itself.

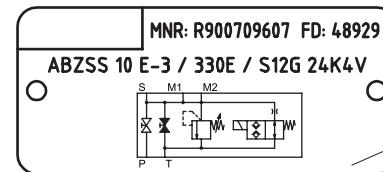

Usually, the warning sign is in the languages according to the country acceptance. Further languages at request.

For hydraulic systems with one or several hydraulic accumulators whose warning signs are not visible after installation into the machine, an additional warning sign has to be attached visibly to the system, stating:

"CAUTION -- system contains hydraulic accumulators."

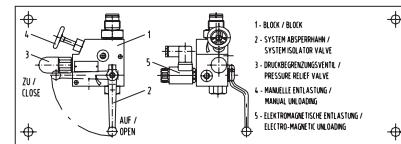

The circuit diagram has to contain the same notice. With mounting "B" and "K", the warning signs and functional signs are supplied loosely and must be attached to or close to the accumulator station in a clearly visible position. The attachment of the signs must already be considered in the design.

Commissioning, maintenance and operating instructions

Commissioning - Operating instructions according to the data sheet of the accumulator!

	DANGER
	<p>Do not charge hydraulic accumulators with oxygen or air. Explosion hazard!</p> <ul style="list-style-type: none"> ▶ Prior to the initial commissioning, the hydraulic accumulator must be filled with nitrogen of class 4.0, pure (N2 content 99.99 vol. %). The preset gas pressure necessary for the operation is indicated in the circuit diagrams and operating instructions. ▶ Only use suitable filling and testing devices for filling. We recommend using the charging and test devices by Bosch Rexroth according to data sheet 50150.
	WARNING
	<ul style="list-style-type: none"> ▶ Risk of injury caused by improper assembly. ▶ Hydraulic accumulators are energy stores. They may supply the energy for uncontrolled movements to actuators. ▶ Before beginning any repairs, the system must be depressurized on the oil and gas side and protected against unauthorized re-start. ▶ Do not carry out welding and soldering works or any mechanical processing on the accumulator tank! Any kind of processing at the product invalidates the declaration of conformity and the operating license! <ul style="list-style-type: none"> – Explosion hazard due to welding and soldering works! – Danger of bursting during and after mechanical processing. ▶ A warning sign is enclosed to the accumulator station. It is to be attached to or close to the accumulator station in a clearly visible position.

Maintenance

	Attention
	<ul style="list-style-type: none"> ▶ In case of damage at the accumulator bladder or diaphragm, the accumulator will lose its function immediately. ▶ Loss of the initial gas tension will lead to damage at the accumulator bladder or the accumulator diaphragm if operation of the system is continued nevertheless. ▶ Check the initial gas tension in regular intervals.

Legal provisions

- ▶ Hydraulic accumulators are pressure vessels and subject to the application of national provisions and/or regulations valid at the place of installation.
- ▶ In Germany, the Ordinance on Industrial Safety and Health (BetrSichV) applies.
- ▶ As a standard, country acceptances are effected according to BA, CE as well as for China and Russia. Other acceptances on request.
- ▶ Special regulations are to be observed in shipbuilding, aircraft construction, mining, etc.
- ▶ Design, production and testing are effected according to the data sheets according to AD 2000. Installation, equipment and operation are regulated by the "Technical rules for pressure vessels" (TRB).

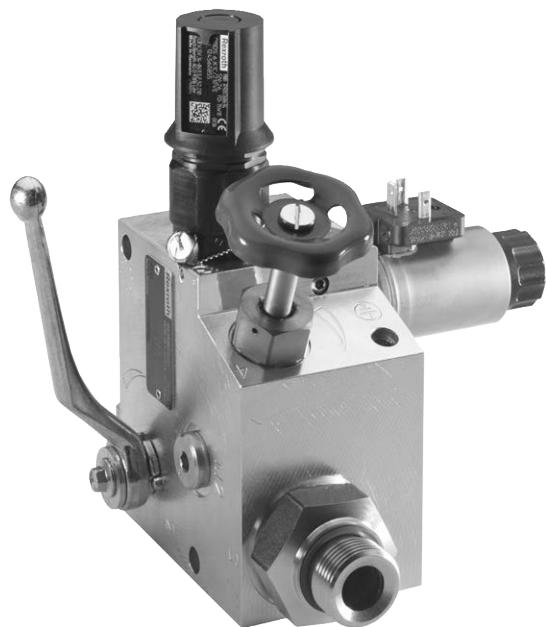

Notes pursuant to the EC Machinery

Directive 2006/42/EC, according to annex II part 1, section A, manufacturer's declaration:

- ▶ The assemblies were manufactured in accordance with the harmonized standards DIN EN ISO 4413, DIN EN ISO 12100, EN 983, and EN 60204-1.
- ▶ Commissioning is prohibited until it was confirmed that the machine into which the assemblies are to be integrated complies with the regulations laid down in the EC Directives.

Function

The accumulator shut-off block serves for the protection, isolation and unloading of hydraulic accumulators. It is classified based on its use according to the Pressure Equipment Directive 2014/68/EU article 4, section 3. The connection between the accumulator shut-off block and the accumulator is realized by means of an accumula-

tor adapter.

The accumulator is protected from inadmissible overpressure by means of the pressure relief valve. The **pressure relief valve** must **not be used for any control tasks**. Sufficient difference between the maximum operating pressure and the working pressure must be ensured. Response of the pressure relief valve should be prevented, if possible.

-  **Important notices on hydraulic fluids:**
- For more information and data on the use of other hydraulic fluids, please refer to the data sheets above or contact us.
 - There may be limitations regarding the technical valve data (temperature, pressure range, life cycle, maintenance intervals, etc.).
 - The ignition temperature of the hydraulic fluid used must be 40 K higher than the maximum solenoid surface temperature.

electrical		
Protection class according to DIN EN 60529	► With connector "K4"	IP 65 (with mating connector mounted and locked)

¹⁾ Special version

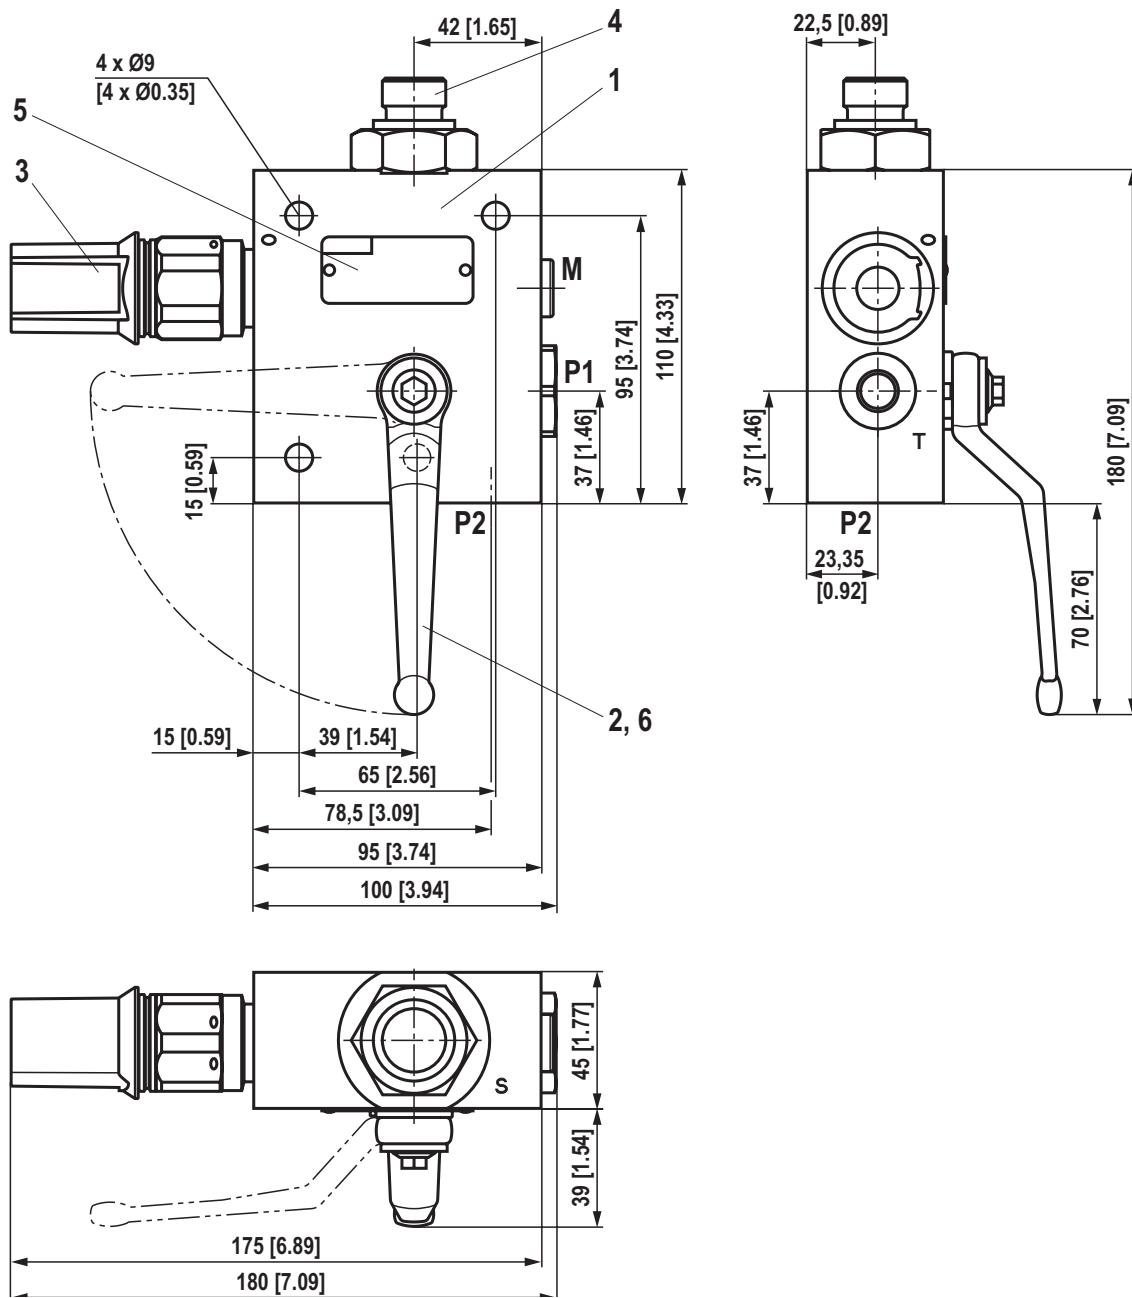

²⁾ The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents faults and simultaneously increases the life cycle of the components.

Characteristic curves: Type-examination tested safety valves type DBD ¹⁾**Size 6 (ABZSS 08, 10)****Size 10 (ABZSS 20)****Size 20 (ABZSS 30, -P30)****Size 30 (ABZSS 30...SO30)****Notice:**

Safety instructions: Type-examination tested safety valves type DBDS ¹⁾

- ▶ Before ordering a type-examination tested safety valve, ensure that for the desired **response pressure p** , the maximum admissible **flow $q_{V\max}$** of the safety valve is larger than the maximum possible flow of the system/ accumulator to be secured.
- According to the Pressure Equipment Directive **2014/68/EU**, the increase in the system pressure due to the flow must not exceed 10% of the set response pressure (see component marking).
- ▶ The maximum admissible flow $q_{V\max}$ stated in the component marking must not be exceeded.
- ▶ Discharge lines of safety valves must end in a risk-free manner. An accumulation of fluids in the discharge system must **not** be possible (see data sheet AD2000 A2).
- ▶ By removing the lead seal at the safety valve, the approval according to the Pressure Equipment Directive becomes void!
- ▶ Basically, the requirements of the Pressure Equipment Directive and of data sheet AD 2000 A2 have to be observed!
- ▶ It is recommended to secure type-examination tested safety valves against inadmissible disassembly by wiring and sealing them with the housing/block (bore available in the adjustment type).

 **It is imperative to observe the application notes!**

- ▶ In the plant, the response pressure specified in the component marking is set at a flow of 2 l/min [0.53 US gpm].
- ▶ The maximum flow stated in the component marking applies for applications without counter pressure in the discharge line (port T).

 **Notice:**

The system pressure increases by the counter pressure in the discharge line (port T) due to the increasing flow. (Observe the data sheet AD 2000 A 2, point 6.3!)

To ensure that this increase in system pressure caused by the flow does not exceed 10% of the set response pressure, the admissible flow has to be reduced dependent on the counter pressure in the discharge line (port T) (see diagrams on page 22 ... 25).

¹⁾ Component series 1X according to the Pressure Equipment Directive 2014/68/EU

Characteristic curves: Counter pressure in the discharge line

In principle, the valve should be operated without counter pressure in the discharge line, if possible. In case of counter pressure in the discharge line, the maximum possible flow is reduced. There is a relationship between maximum counter pressure p_T in the discharge line and flow q_V , which can be seen from the following characteristic curve. Characteristic curves for intermediate values of the response pressure which are not listed must be determined by means of interpolation.

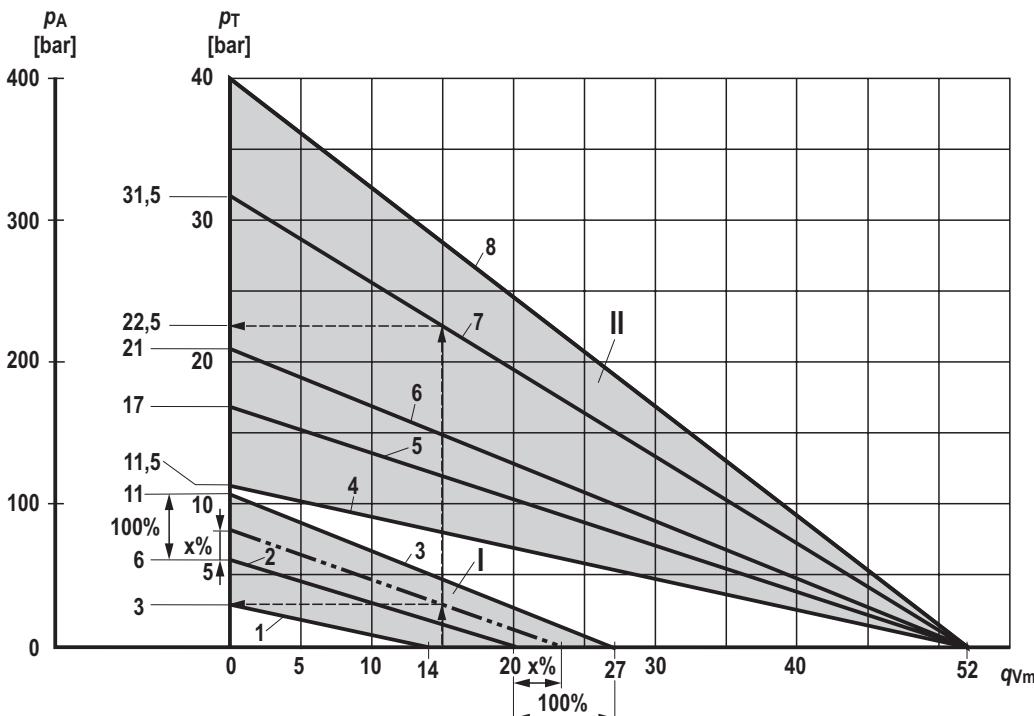

When the flow approaches zero, the maximum counter pressure p_T is in each case 10% of the response pressure. With increasing flow, the maximum counter pressure p_T decreases.

Interpolation of intermediate values from the diagram

1. At the axis p_T , mark 1/10 of the value of p_A .
2. Determine the next lower and the next higher characteristic curve for this point. The point marked at p_T divides the section between lower and higher characteristic curve on the p_T axis with a certain percentage.
3. At the $q_{V_{max}}$ axis, divide the section between next lower and next higher characteristic curve in the same percentage as the section at the p_T axis. From the zero position flow on the $q_{V_{max}}$ axis determined in that way, draw a straight line to the value on the p_T axis marked before.
4. Mark the system flow to be secured at the $q_{V_{max}}$ axis.
5. Read off the maximum counter pressure for this value using the line at the p_T axis drawn before.

Characteristic curves: Counter pressure in the discharge line – size 6

Diagram for determining the maximum counter pressure p_T in the discharge line at port T of the valve dependent on the flow q_{Vmax} for valves DBDS 6...1X/...E with different response pressures p_A .

Characteristic curves	Response pressure p_A in bar [psi]
1	30 [435]
2	60 [870]
3	110 [1595]
4	115 [1668]
5	170 [2465]
6	210 [3046]
7	315 [4568]
8	400 [5800]

Characteristic curves for intermediate values can be generated by interpolation. Further explanations can be found on page 21.

p_A Response pressure in bar

p_T Maximum counter pressure in the discharge line (port T) in bar

q_{Vmax} Maximum flow in l/min

■ I Interpolation area I, for valves with $p_A = 30 \dots 110$ bar and $q_{Vmax} = 14 \dots 27$ l/min

■ II Interpolation area II, for valves with $p_A = 115 \dots 400$ bar and $q_{Vmax} = 27 \dots 52$ l/min

Determination of the maximum counter pressure

Example 1 (with already existing characteristic curve):

Flow of the system / accumulator to be secured: $q_{Vmax} = 15$ l/min
Safety valve set to: $p_A = 315$ bar.

Read off the maximum counter pressure p_T of approx. 22.5 bar from the diagram (see arrows, characteristic curve 7).

Example 2 (with interpolated characteristic curve):

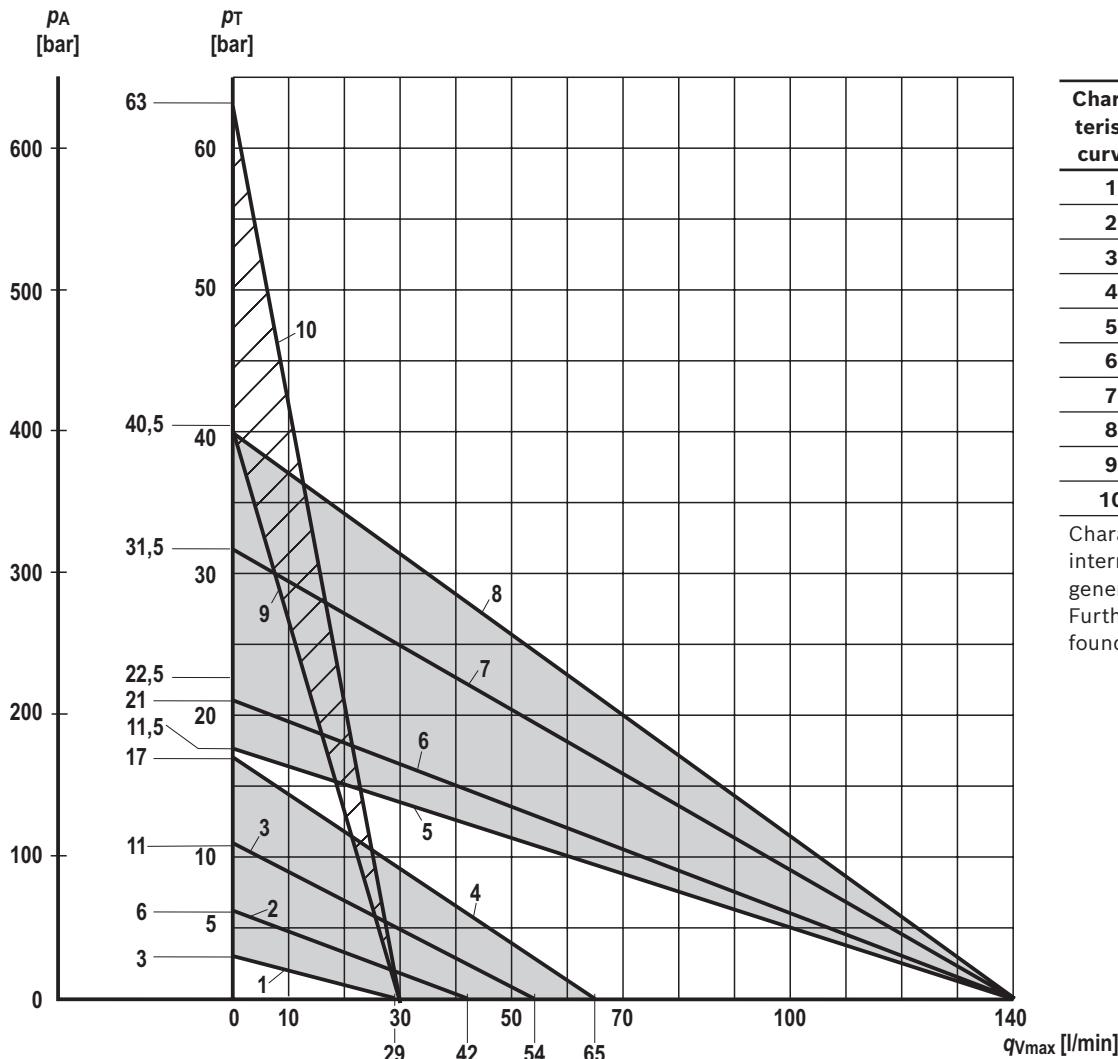

Flow of the system / accumulator to be secured: $q_{Vmax} = 15$ l/min
Safety valve set to: $p_A = 80$ bar.

Value to be marked at the axis referred to as p_T :
 $1/10 \times 80$ bar = 8 bar.

Read off the maximum counter pressure p_T of approx. 3 bar from the diagram (see arrows, dashed characteristic curve).

Characteristic curves: Counter pressure in the discharge line – size 10

Diagram for determining the maximum counter pressure p_T in the discharge line at port T of the valve dependent on the flow $q_{V\max}$ for valves DBDS 10...1X/...E with different response pressures p_A .

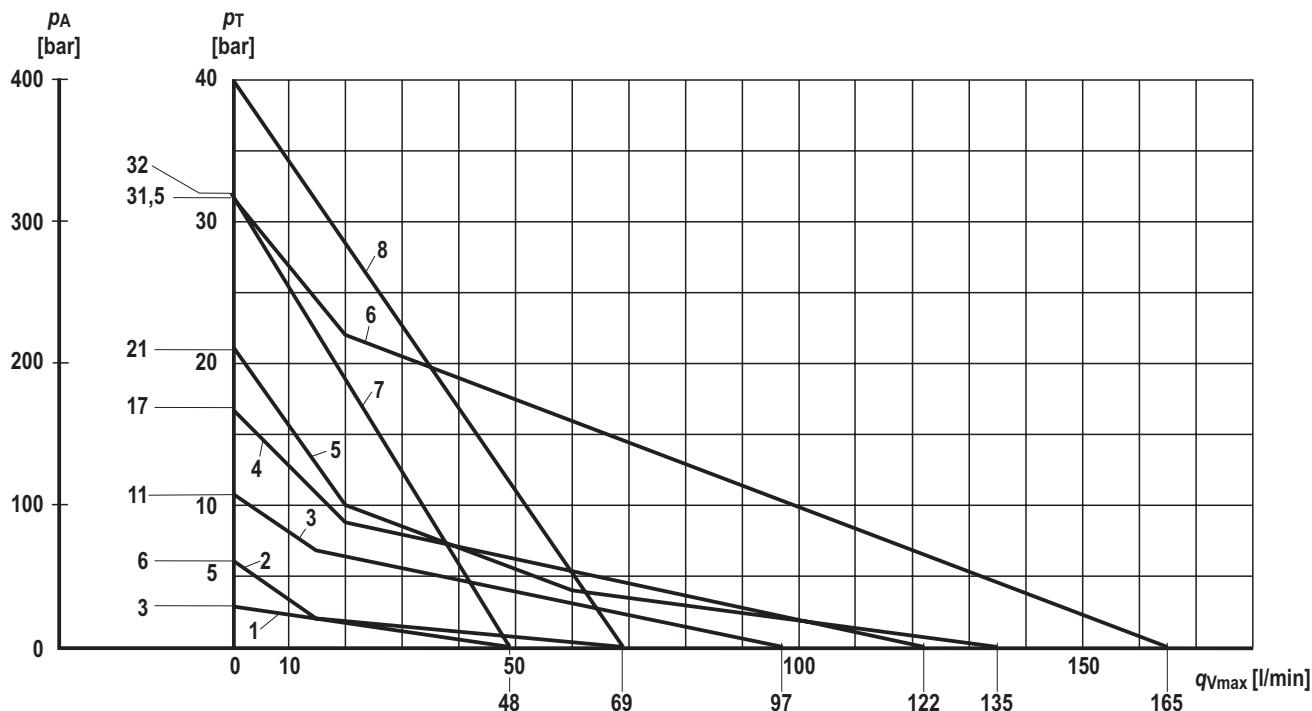

Characteristic curves for intermediate values can be generated by interpolation. Further explanations can be found on page 21.

Accumulator safety block

Type 0532VAW

H7559

- ▶ Nominal diameter DN20, DN32
- ▶ Component series A1
- ▶ Maximum operating pressure 330 bar [*4800 psi*]

Features

- ▶ Ready for connection
- ▶ Manual or electro-magnetic unloading
- ▶ Large number of variants
- ▶ Compact design
- ▶ Direct operated pressure relief valve according to data sheet 50153

Function

The accumulator shut-off block serves for protection, isolation and unloading of hydraulic accumulators. It is classified according to its use according to Pressure Equipment Directive 2014/68/EU article 4, section 3.

The connection between the accumulator shut-off block and the accumulator is realized by means of an accumulator adapter. An optional additional 2-way valve with electrical operation (normally open) enables automatic unloading of the accumulator in case of shutdown or "emergency off function".

The accumulator is protected from inadmissible overpressure by means of the pressure relief valve.

The **pressure relief valve** must **not be applied for any control tasks!**

Sufficient difference between the pressure set at the pressure relief valve and the operating pressure must be ensured. Response of the pressure relief valve should be prevented.

Technical data

(For applications outside these parameters, please consult us.)

Safety instructions: Type-examination tested safety valves type 0532VA according to Pressure Equipment Directive 2014/68/EU

- ▶ Before ordering a type-examination tested safety valve, it must be observed that for the desired **response pressure p** , the maximum admissible **flow $q_{V\max}$** of the safety valve must be larger than the maximum possible flow of the system/accumulator to be secured. In this respect, the applicable regulations must be observed!
- ▶ According to the **Pressure Equipment Directive 2014/68/EU**, the increase in the system pressure due to the flow must not exceed 10% of the set response pressure (see component marking).
- ▶ The maximum admissible flow $q_{V\max}$ stated in the component marking must not be exceeded.
- ▶ Discharge lines of safety valves must end in a risk-free manner. Accumulation of fluids in the discharge system must **not** be possible (see AD2000 - data sheet A2).

Application notes must always be observed!

- ▶ The response pressure specified in the component marking is set at the plant.
- ▶ The maximum admissible flow stated in the component marking applies for applications without counter pressure in the discharge line (port T).
- ▶ By removing the lead seal at the safety valve, the approval according to the Pressure Equipment Directive becomes void!
- ▶ The requirements of the Pressure Equipment Directive and of data sheet AD2000 A2 must be generally observed!
- ▶ It is recommended to secure type-examination tested safety valves against inadmissible removal from the screw-in housing/block by means of wiring and sealing with the housing/block (bore available in the adjustment element).

Notice:

The system pressure increases by the counter pressure in the discharge line (port T) due to the increasing flow. (Observe the data sheet AD2000 A2, point 6.3!)

To ensure that this increase in system pressure caused by the flow does not exceed the value of 10% of the set response pressure, the admissible flow has to be reduced depending on the counter pressure in the discharge line (port T) (see diagram on pages **8** and **9**).
