1 Basic information

1.1 General instructions

The hydraulic fluid is the common element in any hydraulic component and must be selected very carefully. Quality and cleanliness of the hydraulic fluid are decisive factors for the operational reliability, efficiency and service life of a system.

Hydraulic fluids must conform, be selected and used in accordance with the generally acknowledged rules of technology and safety provisions. Reference is made to the country-specific standards and directives (in Germany the directive of the Employer's Liability Insurance Association BGR 137).

This data sheet includes recommendations and regulations concerning the selection, operation and disposal of hydraulic fluids based on mineral oils and related hydrocarbons in the application of Rexroth hydraulic components.

The individual selection of hydraulic fluid or the choice of classification are the responsibility of the operator.

It is the responsibility of the user to ensure that appropriate measures are taken for safety and health protection and to ensure compliance with statutory regulations. The recommendations of the lubricant manufacturer and the specifications given in the safety data sheet are to be observed when using hydraulic fluid.

This data sheet does not absolve the operator from verifying the conformity and suitability of the respective hydraulic fluid for his system. He is to ensure that the selected fluid meets the minimum requirements of the relevant fluid standard during the whole of the period of use.

Other regulations and legal provisions may also apply. The operator is responsible for their observance, e.g. EU directive 2004/35/EG and their national implementations. In Germany the Water Resources Act (WHG) is also to be observed.

We recommend that you maintain constant, close contact with lubricant manufacturers to support you in the selection, maintenance, care and analyses.

When disposing of used hydraulic fluids, apply the same care as during use.

1.2 Scope

This data sheet must be observed when using hydraulic fluids based on mineral oils and related hydrocarbons in Bosch Rexroth hydraulic components.

Please note that the specifications of this data sheet may be restricted further by the specifications given in the product data sheets for the individual components.

The use of the individual hydraulic fluids in accordance with the intended purpose can be found in the safety data sheets or other product description documents of the lubricant manufacturers. In addition, each use is to be individually considered.

Rexroth hydraulic components may only be operated with hydraulic fluids based on mineral oils and related hydrocarbons according to DIN 51524 if specified in the respective component data sheet or if Rexroth approval for use is furnished.

Notes:

In the market overview RE 90220-01, hydraulic fluid based on mineral oil are described which, according to the information of the lubricant manufacturer, feature the respective parameters of the current requirements standard DIN 51524 and other parameters which are of relevance for suitability in connection with Rexroth components.

These specifications are not checked or monitored by Bosch Rexroth. The list in the market overview does not therefore represent a recommendation on the part of Rexroth or approval of the respective hydraulic fluid for use with Rexroth components and does not release the operator from his responsibility regarding selection of the hydraulic fluid.

Bosch Rexroth will accept no liability for its components for any damage resulting from failure to comply with the notes below.

1.3 Safety instructions

Hydraulic fluids can constitute a risk for persons and the environment. These risks are described in the hydraulic fluid safety data sheets. The operator is to ensure that a current safety data sheet for the hydraulic fluid used is available and that the measures stipulated therein are complied with.

2 Solid particle contamination and cleanliness levels

Solid particle contamination is the major reason for faults occurring in hydraulic systems. It may lead to a number of effects in the hydraulic system. Firstly, single large solid particles may lead directly to a system malfunction, and secondly small particles cause continuous elevated wear.

For hydraulic fluids, the cleanliness level is given as a three-digit numerical code in accordance with ISO 4406. This numerical code denotes the number of particles present in a hydraulic fluid for a defined quantity. Moreover, foreign solid matter is not to exceed a mass of 50 mg/kg (gravimetric examination according to ISO 4405).

In general, compliance with a minimum cleanliness level of 20/18/15 in accordance with ISO 4406 or better is to be maintained in operation. Special servo valves demand improved cleanliness levels of at least 18/16/13. A reduction in cleanliness level by one level means half of the quantity of particles and thus greater cleanliness. Lower numbers in cleanliness levels should always be striven for and extend the service life of hydraulic components. The component with the highest cleanliness requirements determines the required cleanliness of the overall system. Please also observe the specifications in table 1: "Cleanliness levels according to ISO 4406" and in the respective data sheets of the various hydraulic components.

Hydraulic fluids frequently fail to meet these cleanliness requirements on delivery. Careful filtering is therefore required during operation and in particular, during filling in order to ensure the required cleanliness levels. Your lubricant manufacturer can tell you the cleanliness level of hydraulic fluids as delivered. To maintain the required cleanliness level over the operating period, you must use a reservoir breather filter. If the environment is humid, take appropriate measures, such as a breather filter with air drying or permanent off-line water separation.

Note: the specifications of the lubricant manufacturer relating to cleanliness levels are based on the time at which the container concerned is filled and not on the conditions during transport and storage.

Further information about contamination with solid matter and cleanliness levels can be found in brochure RE 08016.

Table 1: Cleanliness levels according to ISO 4406

Particles per 100 ml		Scale number
More than	Up to and including	
8,000,000	16,000,000	24
4,000,000	8,000,000	23
2,000,000	4,000,000	22
1,000,000	2,000,000	21
500,000	1,000,000	20
250,000	500,000	19
130,000	250,000	18
64,000	130,000	17
32,000	64,000	16
16,000	32,000	15
8,000	16,000	14
4,000	8,000	13
2,000	4,000	12
1,000	2,000	11
500	1,000	10
250	500	9
130	250	8
64	130	7
32	64	6

3 Selection of the hydraulic fluid

The use of hydraulic fluids based on mineral oils for Rexroth hydraulic components is based on compliance with the minimum requirements of DIN 51524.

3.1 Selection criteria for the hydraulic fluid

The specified limit values for all components employed in the hydraulic system, for example viscosity and cleanliness level, must be observed with the hydraulic fluid used, taking into account the specified operating conditions.

Hydraulic fluid suitability depends, amongst others, on the following factors:

3.1.1 Viscosity

Viscosity is a basic property of hydraulic fluids. The permissible viscosity range of complete systems needs to be determined taking account of the permissible viscosity of all components and it is to be observed for each individual component.

The viscosity at operating temperature determines the response characteristics of closed control loops, stability and damping of systems, the efficiency factor and the degree of wear.

We recommend that the optimum operating viscosity range of each component be kept within the permissible temperature range. This usually requires either cooling or heating, or both. The permissible viscosity range and the necessary cleanliness level can be found in the product data sheet for the component concerned.

If the viscosity of a hydraulic fluid used is above the permitted operating viscosity, this will result in increased hydraulic-mechanical losses. In return, there will be lower internal leakage losses. If the pressure level is lower, lubrication gaps may not be filled up, which can lead to increased wear. For hydraulic pumps, the permitted suction pressure may not be reached, which may lead to cavitation damage.

If the viscosity of a hydraulic fluid is below the permitted operating viscosity, increased leakage, wear, susceptibility to contamination and a shorter component life cycle will result.

3.1.2 Viscosity-temperature behavior

For hydraulic fluids, the viscosity temperature behavior (V-T behavior) is of particular importance. Viscosity is characterized in that it drops when the temperature increases and rises when the temperature drops; see Fig. 1 "Viscosity temperature chart for HL, HLP, HLPD (VI 100)". The interrelation between viscosity and temperature is described by the viscosity index (VI).

The viscosity temperature diagram in Fig. 1 is extrapolated in the $< 40^\circ\text{C}$ range. This idealized diagram is for reference purposes only. Measured values can be obtained from your lubricant manufacturer and are to be preferred for design purposes.

Fig. 1: Viscosity-temperature chart for HL, HLP, HLPD (VI 100, double logarithmic representation)

3.1.3 Wear protection capability

Wear protection capability describes the property of hydraulic fluids to prevent or minimize wear within the components. The wear protection capability is described in DIN 51524-2,-3 via test procedures "FZG gear test rig" (ISO 14635-1) and "Mechanical test in the vane pump" (ISO 20763). From ISO VG 32 DIN 51524-2,-3 prescribes a rating of at least 10 (FZG test). At present, the FZG test cannot be applied to viscosity classes < ISO VG 32.

3.1.4 Material compatibility

The hydraulic fluid must not negatively affect the materials used in the components. Compatibility with coatings, seals, hoses, metals and plastics is to be observed in particular. The fluid classifications specified in the respective component data sheets are tested by the manufacturer with regard to material compatibility. Parts and components not supplied by us are to be checked by the user.

Table 2: Known material incompatibilities

Classification	Incompatible with:
HLxx classifications	with EPDM seals
Zinc- and ash/free hydraulic fluids	with bronze-filled PTFE seals

3.1.5 Aging resistance

The way a hydraulic fluid ages depends on the thermal, chemical and mechanical stress to which it is subjected. Aging resistance can be greatly influenced by the chemical composition of the hydraulic fluids.

High fluid temperatures (e.g. over 80 °C) result in a approximate halving of the fluid service life for every 10 °C temperature increase and should therefore be avoided. The halving of the fluid service life results from the application of the Arrhenius equation (see Glossary).

Table 3: Reference values for temperature-dependent aging of the hydraulic fluid

Reservoir temperature	Fluid life cycle
80 °C	100 %
90 °C	50 %
100 °C	25 %

Hydraulic fluids based on mineral oils and related hydrocarbons are tested with 20% water additive during testing of aging resistance according to ISO 4263-1.

The calculated fluid service life is derived from the results of tests in which the long-term characteristics are simulated in a short period of time by applying more arduous conditions (condensed testing). This calculated fluid service life is not to be equated to the fluid service life in real-life applications.

Table 3 is a practical indicator for hydraulic fluids with water content < 0.1%, cf. chapter 4.10. "Water".

3.1.6 Air separation ability (ASA)

The air separation ability (ASA) describes the property of a hydraulic fluid to separate undissolved air. Hydraulic fluids contain approx. 7 to 13 percent by volume of dissolved air (with atmospheric pressure and 50 °C). Hydraulic fluids always contain dissolved air. During operation, dissolved air may be transformed into undissolved air, leading to cavitation damages. Fluid classification, fluid product, reservoir size and design must be coordinated to take into account the dwell time and ASA value of the hydraulic fluid. The air separation capacity depends on the viscosity, temperature, basic fluid and aging.

It cannot be improved by additives.

According to DIN 51524 for instance, an ASA value ≤ 10 minutes is required for viscosity class ISO VG 46, 6 minutes are typical, lower values are preferable.

3.1.7 Demulsifying ability and water solubility

The capacity of a hydraulic fluid to separate water at a defined temperature is known as the demulsifying ability. ISO 6614 defines the demulsifying properties of hydraulic fluids.

For larger systems with permanent monitoring, a demulsifying fluid with good water separation capability (WSC) is recommended. The water can be drained from the bottom of the reservoir. In smaller systems (e.g. in mobile machines), whose fluid is less closely monitored and where water contamination into the hydraulic fluid, for instance through air condensation, cannot be ruled out completely, an HLPD fluid is recommended.

The demulsifying ability up to ISO-VG 100 is given at 54 °C, and at 82 °C for fluids with higher viscosity.

Water emulsifying HLPD hydraulic fluids have no, or a very poor, demulsifying ability.

3.1.8 Filterability

Filterability describes the ability of a hydraulic fluid to pass through a filter, removing solid contaminants. The hydraulic fluids used require a good filterability, not just when new, but also during the whole of their service life. Depending on the basic fluid used and the additives (VI enhancers) there are great differences here.

The filterability is a basic prerequisite for cleanliness, servicing and filtration of hydraulic fluids. Filterability is tested with the new hydraulic fluid and after the addition of 0.2 % water. The underlying standard (ISO 13357-1/-2) stipulates that filterability must have no negative effects on the filters or the hydraulic fluid, see chapter 4 "Hydraulic fluids in operation".

3.1.9 Corrosion protection

Hydraulic fluids should not just prevent corrosion formation on steel components, they must also be compatible with non-ferrous metals and alloys. Corrosion protection tests on different metals and metal alloys are described in DIN 51524. Hydraulic fluids that are not compatible with the materials listed above must not be used, even if they are compliant with ISO 51524.

Rexroth components are usually tested with HLP hydraulic fluids or corrosion protection oils based on mineral oils before they are delivered.

3.1.10 Additivation

The properties described above can be modified with the help of suitable additives. A general distinction is made for fluids between heavy metal-free and heavy metal-containing (generally zinc) additive systems. Both additive systems are most often incompatible with each other. The mixing of these fluids must be avoided even if the mixing ratio is very low. See chapter 4, "Hydraulic fluids in operation".

Increasing additivation generally leads to deteriorated air separation ability (ASA) and water separation capability (WSC) of the hydraulic fluid. According to the present state of knowledge, all hydraulic fluids described in this document, independently of the actual additivation, can be filtered using all filter materials with all known filtration ratings $\geq 1 \mu\text{m}$ without filtering out effective additives at the same time.

Bosch Rexroth does not prescribe any specific additive system.

3.2 Classification and fields of application

Table 4: Classification and fields of application

Classification	Features	Typical field of application	Notes
HL fluids according to DIN 51524-1 VI = 100	Hydraulic fluids predominantly only with additives for oxidation and corrosion protection, but no specific additives for wear protection in case of mixed friction	HL fluids can be used in hydraulic systems that do not pose any requirements as to wear protection.	HL fluids may be used only for components whose product data sheet specifically allows HL fluids. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner. Hydraulic fluids that only comply with the requirements of classes HL and HR in accordance with ISO 11158 without proving that DIN 51524-1 is also met may be used only with written approval of Bosch Rexroth AG. Observe restrictions as to pressure, rotation speed etc.
HLP fluids according to DIN 51524-2 VI = 100	Hydraulic fluid with corrosion, oxidation and verified wear protection additives	HLP fluids are suitable for most fields of application and components provided the temperature and viscosity provisions are observed.	For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner. For the viscosity classes VG10, VG15 and VG22, DIN 51524 defines no requirements as to wear protection (DIN 51354 part 2 and DIN 51389 part 2). Beyond the requirements of DIN 51524 part 2, we require the same base oil type, identical refining procedure, identical additivation and identical additivation level across all viscosity classes.

Continued on page 8

Table 4: Classification and fields of application (continued from page 7)

Classification	Features	Typical field of application	Notes
<p>HVLP fluids according to DIN 51524-3 VI > 140</p>	<p>HLP hydraulic fluid with additional improved viscosity temperature behavior</p>	<p>HVLP fluids are used in systems operated over a wide temperature range.</p>	<p>For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <p>The same notes and restrictions as defined for HLP fluids apply accordingly.</p> <p>The effect on Rexroth components (e.g. compatibility with material seals, wear resistance capacity) may differ when using related hydrocarbons instead of mineral oils, cf. Table 6, line 8.</p> <p>When using HVLP fluids, the viscosity may change on account of the shear of the long-chain VI enhancers. The viscosity index, high at the start, decreases during operation. This needs to be taken into account when selecting the hydraulic fluid.</p> <p>The only value at present that can be used to assess viscosity changes in operation is the result of the test in accordance with DIN 51350 part 6. Please note that there are practical applications that create a much higher shear load on such fluids than can be achieved by this test. Up to VI < 160, we recommend a maximum permitted viscosity drop of 15 %, viscosity at 100 °C.</p> <p>The viscosity limits given by Bosch Rexroth for its components are to be observed for all operating conditions, even after the hydraulic fluids have sheared.</p> <p>HVLP fluids should be used only if required by the temperature ranges of the application.</p>
<p>HLPD fluids according to DIN 51524-2, HVLPD fluids in accordance with DIN 51524-3</p>	<p>HLP and HVLP hydraulic fluid with additional detergent and or dispersant additives</p>	<p>HLPD and HVLPD fluids are used in systems where deposits as well as solid or liquid contamination need to be kept temporarily suspended</p>	<p>For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <p>Some of these fluids are able to absorb significant quantities of water (> 0.1 %). This may have negative implications for the wear protection and the aging properties of the fluid.</p> <p>The wetting ability of these fluids varies largely depending on the product. Therefore it is not correct to say that they are generally all very well able to prevent stick-slip.</p> <p>In individual cases where higher water contamination is to be expected (such as in steelworks or under humid conditions), the use of HLPD/HVLPD fluids cannot be recommended as the emulsified water does not settle in the reservoir but is evaporated in heavily loaded positions. For such cases, we recommend using HLP hydraulic fluids with particularly good demulsifying ability. The water collected at the reservoir bottom is to be drained regularly.</p> <p>If HLPD/HVLPD fluids are used, contamination does not settle. It rather remains suspended and needs to be filtered out or removed by appropriate draining systems. For this reason, the filter area must be increased.</p> <p>HLPD/HVLPD fluids may contain additives that in the long run are incompatible with plastics, elastomers and non-ferrous metals. Furthermore, these additives may lead to the premature clogging of hydraulic filters. Therefore, test the filterability and the selection of the filter material in consultation with the filter manufacturer.</p>

4 Hydraulic fluids in operation

4.1 General

The properties of hydraulic fluids can change continually during storage and operation.

Please note that the fluid standard DIN 51524 merely describes minimum requirements for hydraulic fluids in new condition at the time of filling into the bins. The operator of a hydraulic system must ensure that the hydraulic fluid remains in a utilizable condition throughout its entire period of use.

Deviations from the characteristic values are to be clarified with the lubricant manufacturer, the test labs or Bosch Rexroth.

Please note the following aspects in operation.

4.2 Storage and handling

Hydraulic fluids must be stored correctly in accordance with the instructions of the lubricant manufacturer. Avoid exposing the containers to lengthy periods of direct heat. Containers are to be stored in such a way that the risk of any foreign liquid or solid matter (e.g. water, foreign fluids or dust) ingress into the inside of the container can be ruled out. After taking hydraulic fluids from the containers, these are immediately to be properly resealed.

Recommendation:

- Store containers in a dry, roofed place
- Store barrels on their sides
- Clean reservoir systems and machine reservoirs regularly

4.3 Filling of new systems

Usually, the cleanliness levels of the hydraulic fluids as delivered do not meet the requirements of our components. Hydraulic fluids must be filtered using an appropriate filter system to minimize solid particle contamination and water in the system.

As early as possible during test operation, new systems should be filled with the selected hydraulic fluid so as to reduce the risk of accidentally mixing the fluids (see chapter 4.5 "Mixing and compatibility of different hydraulic fluids"). Changing the hydraulic medium at a later point represents significant additional costs (see following chapter).

4.4 Hydraulic fluid changeover

Changeovers, in particular between hydraulic fluids with heavy metal-free and heavy metal-containing (generally zinc) additives, frequently lead to malfunctions, see chapter 3.1.10 "Additivation".

In the case of changeovers of the fluid in hydraulic systems, it is important to ensure compatibility of the new hydraulic fluid with the remainder of the previous hydraulic fluid. We recommend obtaining a written performance guarantee from the manufacturer or supplier of the new hydraulic fluid. The quantity of old fluid remaining should be minimized. Mixing hydraulic fluids should be avoided, see following chapter.

For information on changing over hydraulic fluids with different classifications please refer to VDMA 24314, VDMA 24569 and ISO 15380 appendix A.

Bosch Rexroth will not accept liability for any damage to its components resulting from inadequate hydraulic fluid changeovers!

4.5 Mixing and compatibility of different hydraulic fluids

If hydraulic fluids from different manufacturers or different types from the same manufacturer are mixed, gelling, silting and deposits may occur. These, in turn, may cause foaming, impaired air separation ability, malfunctions and damage to the hydraulic system.

If the fluid contains more than 2 % of another fluid then it is considered to be a mixture. Exceptions apply for water, see chapter 4.10 "Water".

Mixing with other hydraulic fluids is not generally permitted. This also includes hydraulic fluids with the same classification and from the market overview RE 90220-01. If individual lubricant manufacturers advertise miscibility and/or compatibility, this is entirely the responsibility of the lubricant manufacturer.

Bosch Rexroth customarily tests all components with mineral oil HLP before they are delivered.

Note: With connectible accessory units and mobile filtering systems, there is a considerable risk of non-permitted mixing of the hydraulic fluids!

Rexroth will not accept liability for any damage to its components resulting from mixing hydraulic fluids!

4.6 Re-additivation

Additives added at a later point in time such as colors, wear reducers, VI enhancers or anti-foam additives, may negatively affect the performance properties of the hydraulic fluid and the compatibility with our components and therefore are not permissible.

Rexroth will not accept liability for any damage to its components resulting from re-additivation!

4.7 Foaming behavior

Foam is created by rising air bubbles at the surface of hydraulic fluids in the reservoir. Foam that develops should collapse as quickly as possible.

Common hydraulic fluids in accordance with DIN 51524 are sufficiently inhibited against foam formation in new condition. On account of aging and adsorption onto surfaces, the defoamer concentration may decrease over time, leading to a stable foam.

Defoamers may be re-dosed only after consultation with the lubricant manufacturer and with his written approval.

Defoamers may affect the air separation ability.

4.8 Corrosion

The hydraulic fluid is to guarantee sufficient corrosion protection of components under all operating conditions, even in the event of impermissible water contamination.

During storage and operation, hydraulic fluid based on mineral oils with anti-corrosion additives protect components against water and "acidic" oil degradation products.

4.9 Air

Under atmospheric conditions, the hydraulic fluid contains dissolved air. In the negative pressure range, for instance in the suction pipe of the pump or downstream of control edges, this dissolved air may transform into undissolved air. The undissolved air content represents a risk of cavitation and of the diesel effect. This results in material erosion of components and increased hydraulic fluid aging.

With the correct measures, such as suction pipe and reservoir design, and an appropriate hydraulic fluid, air intake and separation can be positively influenced.

See also chapter 3.1.7 "Air separation ability (ASA)".

4.10 Water

Water contamination in hydraulic fluids can result from direct ingress or indirectly through condensation of water from the air due to temperature variations.

Water in the hydraulic fluid may result in wear or direct failure of hydraulic components. Furthermore, a high water content in the hydraulic fluid negatively affects aging and filterability and increases susceptibility to cavitation.

Undissolved water can be drained from the bottom of the reservoir. Dissolved water can be removed only by using appropriate measures. If the hydraulic system is used in humid conditions, preventive measures need to be taken, such as an air dehumidifier at the reservoir vent. During operation, the water content in all hydraulic fluids, determined according to the "Karl Fischer method" (see chapter 6 "Glossary") for all hydraulic fluids must constantly be kept below 0.1% (1000 ppm). To ensure a long service life of both hydraulic fluids and components, Bosch Rexroth recommends that values below 0.05% (500 ppm) are permanently maintained.

To ensure a long service life for the hydraulic fluids and the components, we recommend that values below 0.05 % (500 ppm) are permanently maintained. Detergent and or dispersant hydraulic fluids (HLPD / HVLPD) are able to absorb (and keep suspended) more water. Prior to using these hydraulic fluids, please contact the lubricant manufacturer.

4.11 Fluid servicing, fluid analysis and filtration

Air, water, operating temperature influences and solid matter contamination will change the performance characteristics of hydraulic fluids and cause them to age.

To preserve the usage properties and ensure a long service life for hydraulic fluid and components, the monitoring of the fluid condition and a filtration adapted to the application requirements (draining and degassing if required) are indispensable.

The effort is higher in the case of unfavorable usage conditions, increased stress for the hydraulic system or high expectations as to availability and service life, see chapter 2 "Solid particle contamination and cleanliness level".

When commissioning a system, please note that the required minimum cleanliness level can frequently be attained only by flushing the system. Due to severe start-up contamination, it may be possible that a fluid and/or filter replacement becomes necessary after a short operating period (< 50 operating hours).

The hydraulic fluid must be replaced in regular intervals and tested by the lubricant manufacturer or recognized, accredited test labs. **We recommend a reference analysis after commissioning.**

The minimum data to be tested for analyses are:

- Viscosity at 40 °C and 100 °C
- Neutralization number NN (acid number AN)
- Water content (Karl-Fischer method)
- Particle measurement with evaluation according to ISO 4406 or mass of solid foreign substances with evaluation to EN 12662
- Element analysis (RFA (EDX) / ICP, specify test method)
- Comparison with new product or available trend analyses
- Assessment / evaluation for further use
- Also recommended: IR spectrum

Compared to the pure unused hydraulic fluid, the changed neutralization number NN (acid number AN) indicates how many aging products are contained in the hydraulic fluid. This value must be kept as low as possible. As soon as the trend analysis notes a significant increase in the acid number, the lubricant manufacturer should be contacted.

In case of warranty, liability or guarantee claims to Bosch Rexroth, service verification and/or the results of fluid analyses are to be provided.

5 Disposal and environmental protection

Hydraulic fluids based on mineral oil and related hydrocarbons are hazardous for the environment. They are subject to a special disposal obligation.

The respective lubricant manufacturers provide specifications on environmentally acceptable handling and storage. Please ensure that spilt or splashed fluids are absorbed with appropriate adsorbents or by a technique that prevents it contaminating water courses, the ground or sewerage systems.

It is also not permitted to mix fluids when disposing of hydraulic fluids. Regulations governing the handling of used oils stipulate that used oils are not to be mixed with other products, e.g. substances containing halogen. Non-compliance will increase disposal costs. Comply with the national legal provisions concerning the disposal of the corresponding hydraulic fluid. Comply with the local safety data sheet of the lubricant manufacturer for the country concerned.

6 Other hydraulic fluids based on mineral oil and related hydrocarbons

Table 6: Other hydraulic fluids based on mineral oils and related hydrocarbons

Serial number	Hydraulic fluids	Features / Typical field of application / Notes
1	Hydraulic fluids with classification HL, HM, HV according to ISO 11158	<ul style="list-style-type: none"> – Can be used without confirmation provided they are listed in the respective product data sheet and are compliant with DIN 51524. Conformity with DIN 51524 must be verified in the technical data sheet of the fluid concerned. For classification see Table 4: "Hydraulic fluid classification". – Fluids only classified in accordance with ISO 11158 may be used only with prior written approval of Bosch Rexroth AG.
2	Hydraulic fluids with classification HH, HR, HS, HG according to ISO 11158	<ul style="list-style-type: none"> – May not be used.
3	Hydraulic fluids with classification HL, HLP, HLPD, HVLP, HVLPD to DIN 51502	<ul style="list-style-type: none"> – DIN 51502 merely describes how fluids are classified / designated on a national level. – It contains no information on minimum requirements for hydraulic fluids. – Hydraulic fluids standardized according to DIN 51502 can be used without confirmation provided they are listed in the respective product data sheet and are compliant with DIN 51524. Conformity with DIN 51524 must be verified in the technical data sheet of the fluid concerned. For classification see Table 4: "Hydraulic fluid classification".
4	Hydraulic fluids with classification HH, HL, HM, HR, HV, HS, HG according to ISO 6743-4	<ul style="list-style-type: none"> – ISO 6743-4 merely describes how fluids are classified / designated on an international level. It contains no information on minimum requirements for hydraulic fluids. – Hydraulic fluids standardized according to ISO 6743 -4 can be used without confirmation provided they are listed in the respective product data sheet and are compliant with DIN 51524. Conformity with DIN 51524 must be verified in the technical data sheet of the fluid concerned. For classification see table 4: "Classification and fields of application".
5	Lubricants and regulator fluids for turbines to DIN 51515-1 and -2	<ul style="list-style-type: none"> – Turbine oils can be used after confirmation and with limited performance data. – They usually offer lower wear protection than mineral oil HLP. Classification of turbine oils to DIN 51515-1 comparable to HL, turbine oils to DIN 51515-2 comparable to HLP. – Particular attention must be paid to material compatibility!
6	Lube oils C, CL, CLP in accordance with DIN 51517	<ul style="list-style-type: none"> – Lube oils in acc. with DIN 51517 can be used after confirmation and with limited performance data. They are mostly higher-viscosity fluids with low wear protection. Classification: CL similar to HL fluids and CLP similar to HLP fluids. – Particular attention must be paid to material compatibility, specifically with non-ferrous metals!
7	Fluids to be used in pharmaceutical and foodstuff industries, in acc. with FDA / USDA / NSF H1	<ul style="list-style-type: none"> – There are medical white oils and synthetic hydrocarbons (PAO). – Can only be used after consultation and approval for use in the specific application, even if they are compliant with DIN 51524. – May be used only with FKM seals. – Other fluids used in pharmaceutical and foodstuff industries may be used only after confirmation. – Attention is to be paid to material compatibility in accordance with the applicable food law. <p>Caution! Fluids used in pharmaceutical and foodstuff industries should not be confused with environmentally acceptable fluids!</p>

Continued on page 13

Table 6: Other hydraulic fluids based on mineral oils and related hydrocarbons

(continued from page 12)

Serial number	Hydraulic fluids	Features / Typical field of application / Notes
8	Hydraulic fluids of classes HVLP and HVLPD based on related hydrocarbons	<ul style="list-style-type: none"> - Can only be used after consultation and approval for use in the specific application, even if they are compliant with DIN 51524. - Lower pour point than HLP - Other wetting (polarity)
9	Automatic Transmission Fluids (ATF)	<ul style="list-style-type: none"> - ATF are operating fluids for automatic gearboxes in vehicles and machines. In special cases, ATFs are also used for certain synchronous gearboxes and hydraulic systems comprising gearboxes. - To be used only after confirmation! - Some of these fluids have poor air separation abilities and modified wear properties. - Check material compatibility and filterability!
10	Multi-purpose oil (MFO) – Industry	<ul style="list-style-type: none"> - Multi-purpose oils (industry) combine at least two requirements for a fluid, for instance metal machining and hydraulics. - To be used only after confirmation! - Please pay particular attention to air separation ability, modified wear properties and the reduced material life cycle. - Check material compatibility and filterability!
11	Multi-purpose oils (MFO) – Mobil UTTO, STOU	<ul style="list-style-type: none"> - Multi-purpose oils combine requirements for wet brakes, gearboxes, motor oil (STOU only) and hydraulics. - Fluids of the types: <ul style="list-style-type: none"> - UTTO (= universal tractor transmission oil) and - STOU (= Super Tractor super tractor universal oil) - To be used only after confirmation! - Please pay particular attention to shear stability, air separation ability and modified wear properties. - Check material compatibility and filterability!
12	Single-grade engine oils 10W, 20W, 30W	<ul style="list-style-type: none"> - To be used only after confirmation! - Please pay particular attention to the air separation ability and filtering ability.
13	Multi-grade engine oils 0Wx-30Wx	<ul style="list-style-type: none"> - To be used only after confirmation! - Please pay particular attention to air separation ability, changes in wear protection capability, viscosity changes during operation, material compatibility, dispersant and detergent properties and filterability. Caution! Multi-grade engine oils have been adapted to specific requirements in combustion engines and are suitable for use in hydraulic systems only to a limited extent.
14	Motor vehicle transmission oils	<ul style="list-style-type: none"> - Motor vehicle transmission oil can be used after confirmation and with limited performance data. - Pay particular attention to wear protection, material compatibility, specifically with non-ferrous metals, as well as viscosity!
15	Diesel, test diesel in acc. with DIN 4113	<ul style="list-style-type: none"> - Diesel / test diesel has poorer wear protection capabilities and a very low viscosity (< 3 mm²/s). - May be used only with FKM seals - Please note their low flash point! - To be used only after confirmation and with limited performance data!

Continued on page 14

Table 6: Other hydraulic fluids based on mineral oils and related hydrocarbons
 (continued from page 13)

Serial number	Hydraulic fluids	Features / Typical field of application / Notes
16	Hydraulic fluids for roller processes	<ul style="list-style-type: none"> – Hydraulic fluids for roller processes have lower wear protection capabilities than mineral oil HLP and a lower viscosity – Please note their low flash point! – Hydraulic fluids for roller processes with limited performance data can be used only after confirmation.
17	Fluids for power steering, hydro-pneumatic suspension, active chassis etc.	<ul style="list-style-type: none"> – Can only be used after consultation and approval for use in the specific application, even if they are compliant with DIN 51524. – Please note the low viscosity! – In most cases they have poor water separation capability – Check the material compatibility!

7 Glossary

Additivation

Additives are chemical substances added to the basic fluids to achieve or improve specific properties.

Aging

Hydraulic fluids age due to oxidation (see chapter 3.1.5 "Aging resistance"). Liquid and solid contamination acts as a catalyzer for aging, meaning that it needs to be minimized as far as possible by careful filtration.

API classification

Classification of basic fluids by the American Petroleum Institute (API) – the largest association representing the US oil and gas industry.

Arrhenius equation

The quantitative relation between reaction rate and temperature is described by an exponential function, the Arrhenius equation. This function is usually visualized within the typical temperature range of the hydraulic system. For a practical example, see chapter 3.1.5 "Aging resistance".

Related hydrocarbons

Related hydrocarbons are hydrocarbon compounds that are not classified as API class 1, 2 or 5.

Basic fluids

In general, a hydraulic fluid is made up of a basic fluid, or base oil, and chemical substances, the so-called additives. The proportion of basic fluid is generally greater than 90%.

Demulsifying

Ability of a fluid to separate water contamination quickly; achieved with careful selection of base oil and additives.

Detergent

Ability of certain additives to emulsify part of the water contamination in the oil or to hold it in suspension until it has evaporated with increasing temperature. Larger water quantities, in contrast (above approx. 2 %), are separated immediately.

Dispersant

Ability of certain additives to keep insoluble liquid and solid contamination in suspension in the fluid.

Diesel effect

If hydraulic fluid that contains air bubbles is compressed quickly, the bubbles are heated to such a degree that a self-ignition of the air-gas mix may occur. The resultant temperature increase may lead to seal damage and increased aging of the hydraulic fluid.

Hydraulic fluids based on mineral oils

Hydraulic fluids based on mineral oils are made from petroleum (crude oil).

ICP (atomic emission spectroscopy)

The ICP procedure can be used to determine various wear metals, contamination types and additives. Practically all elements in the periodic system can be detected with this method.

Karl Fischer method

Method to determine the water content in fluids. Indirect coulometric determination procedure in accordance with DIN EN ISO 12937 in connection with DIN 51777-2. Only the combination of both standards will assure adequately accurate measured values.

Cavitation

Cavitation is the creation of cavities in fluids due to pressure reduction below the saturated vapour pressure and subsequent implosion when the pressure increases. When the cavities implode, extremely high acceleration, temperatures and pressure may occur temporarily, which may damage the component surfaces.

Neutralization number (NN)

The neutralization number (NN) or acid number (AN) specifies the amount of caustic potash required to neutralize the acid contained in one gram of fluid.

Pour point

The lowest temperature at which the fluid still just flows when cooled down under set conditions. The pour point is specified in the lubricant manufacturers' technical data sheets as a reference value for achieving this flow limit.

RFA (wavelength dispersive x-ray fluorescence analysis)

Is a procedure to determine nearly all elements in liquid and solid samples with nearly any composition. This analysis method is suitable for examining additives and contamination, delivering fast results.

Shearing/shear loss

Shearing of molecule chains during operation can change the viscosity of hydraulic fluids with long chain VI enhancers. The initially high viscosity index drops. This needs to be taken into account when selecting the hydraulic fluid.

The only value at present that can be used to assess viscosity changes in operation is the result of the test in accordance with DIN 51350 part -6. Please note that there are practical applications that create a much higher shear load on such hydraulic fluids than can be achieved by this test.

Stick-slip effect (sliding)

Interaction between a resilient mass system involving friction (such as cylinder + oil column + load) and the pressure increase at very low sliding speeds. The static friction of the system is a decisive value here. The lower it is, the lower the speed that can still be maintained without sticking. Depending on the tribologic system, the stick-slip effect may lead to vibrations generated and sometimes also to significant noise emission. In many cases, the effect can be attenuated by replacing the lubricant.

Viscosity

Viscosity is the measure of the internal friction of a fluid to flow. It is defined as the property of a substance to flow under tension. Viscosity is the most important characteristic for describing the load-bearing capacity of a hydraulic fluid.

Kinematic viscosity is the ratio of the dynamic viscosity and the density of the fluid; the unit is mm²/s. Hydraulic fluids are classified by their kinematic viscosity into ISO viscosity classes. The reference temperature for this is 40 °C.

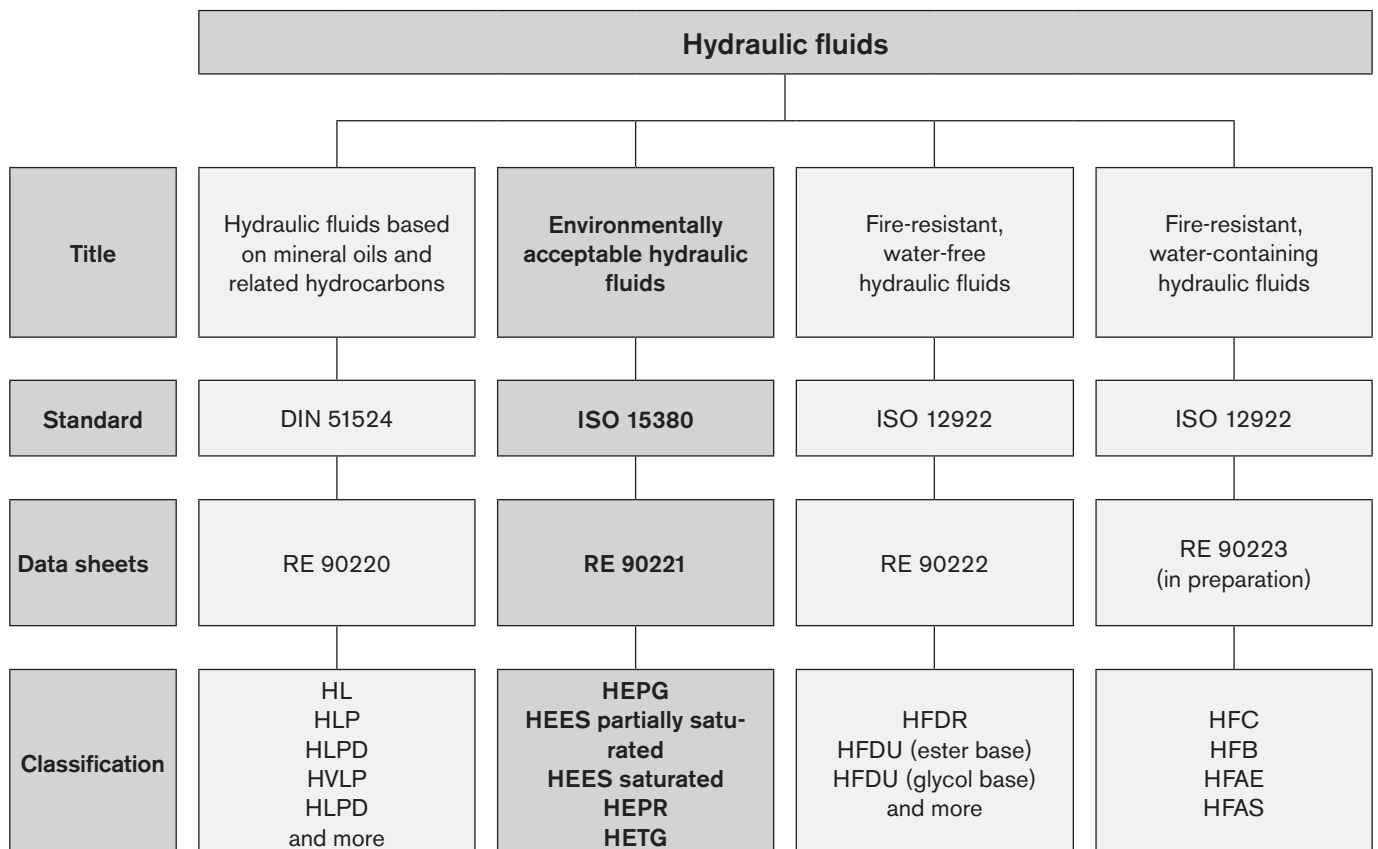

Viscosity index (VI)

Refers to the viscosity temperature behavior of a fluid. The lower the change of viscosity in relation the temperature, the higher the VI.

1 Basic information

1.1 General instructions

The hydraulic fluid is the common element in any hydraulic component and must be selected very carefully. Quality and cleanliness of the hydraulic fluid are decisive factors for the operational reliability, efficiency and service life of a system.

Hydraulic fluids must conform, be selected and used in accordance with the generally acknowledged rules of technology and safety provisions. Reference is made to the country-specific standards and directives (in Germany the directive of the Employer's Liability Insurance Association BGR 137).

This data sheet includes recommendations and regulations concerning the selection, operation and disposal of environmentally compatible hydraulic fluids in the application of Rexroth hydraulic components.

The individual selection of hydraulic fluid or the choice of classification are the responsibility of the operator.

It is the responsibility of the user to ensure that appropriate measures are taken for safety and health protection and to ensure compliance with statutory regulations. The recommendations of the lubricant manufacturer and the specifications given in the safety data sheet are to be observed when using hydraulic fluid.

This data sheet does not absolve the operator from verifying the conformity and suitability of the respective hydraulic fluid for his system. He is to ensure that the selected fluid meets the minimum requirements of the relevant fluid standard during the whole of the period of use.

Other regulations and legal provisions may also apply. The operator is responsible for their observance, e.g. EU directive 2004/35/EG, 2005/360/EG and their national implementation. In Germany the Water Resources Act (WHG) is also to be observed.

We recommend that you maintain constant, close contact with lubricant manufacturers to support you in the selection, maintenance, care and analyses.

When disposing of used hydraulic fluids, apply the same care as during use.

Environmentally acceptable hydraulic fluids have been used successfully for many years. In some countries, the use of environmentally acceptable hydraulic fluids is already prescribed in ecologically sensitive areas (e.g. forestry, locks, weirs).

Environmentally acceptable hydraulic fluids may only be used in the pharmaceutical and food industry subject to required certification to FDA/USDA/NSF H1.

1.2 Environmental compatibility

There is no unambiguous legal definition for environmentally acceptable hydraulic fluids as different testing procedures can be applied for biological degradation and toxicity.

According to ISO 15380 the definition of "environmentally acceptable" is as follows: Humans, animals, plants, air and soil must not be endangered. With regard to hydraulic fluids in an unused condition in the bin this mainly means:

- biological degradation at least 60 %
(according to ISO 14593 or ISO 9439)
- acute fish toxicity at least 100 mg/l
(according to ISO 7346-2)

- acute daphnia toxicity at least 100 mg/l
(according to ISO 5341)
- acute bacteria toxicity at least 100 mg/l
(according to ISO 8192)

The same amount of care should be taken when handling environmentally acceptable hydraulic fluids as for mineral oils, leakage from the hydraulic system should be avoided. Environmentally acceptable hydraulic fluids are designed so that in the event of accidents and leakage, less permanent environmental damage is caused than by mineral oils, see also chapter 5 "Disposal and environmental protection".

In comparison to mineral oil HLP/HVLP, the biological degradation of environmentally acceptable hydraulic fluids may change fluid aging, see chapter 3.1.5 "Aging resistance", 3.1.6 "Biological degradation" and 4 "Hydraulic fluids in operation".

1.3 Scope

This data sheet must be applied when using environmentally acceptable hydraulic fluids with Rexroth hydraulic components. The specifications of this data sheet may be further restricted by the specification given in the data sheets for the individual components.

The use of the individual environmentally acceptable hydraulic fluids in accordance with the intended purpose can be found in the safety data sheets or other product description documents of the lubricant manufacturers. In addition, each use is to be individually considered.

Rexroth hydraulic components may only be operated with environmentally acceptable hydraulic fluids according to ISO 15380 if specified in the respective component data sheet or if a Rexroth approval for use is furnished.

The manufacturers of hydraulic systems must adjust their systems and operating instructions to the environmentally acceptable hydraulic fluids.

Notes:

In the market overview RE 90221-01, environmentally acceptable hydraulic fluids based on mineral oil are described which, according to the information of the lubricant manufacturer, feature the respective parameters of the current requirements standard ISO 15380 and other parameters which are of relevance for suitability in connection with Rexroth components.

These specifications are not checked or monitored by Bosch Rexroth. The list in the market overview does not therefore represent a recommendation on the part of Rexroth or approval of the respective hydraulic fluid for use with Rexroth components and does not release the operator from his responsibility regarding selection of the hydraulic fluid.

Bosch Rexroth will accept no liability for its components for any damage resulting from failure to comply with the notes below.

1.4 Safety instructions

Hydraulic fluids can constitute a risk for persons and the environment. These risks are described in the hydraulic fluid safety data sheets. The operator is to ensure that a current safety data sheet for the hydraulic fluid used is available and that the measures stipulated therein are complied with.

2 Solid particle contamination and cleanliness levels

Solid particle contamination is the major reason for faults occurring in hydraulic systems. It may lead to a number of effects in the hydraulic system. Firstly, single large solid particles may lead directly to a system malfunction, and secondly small particles cause continuous elevated wear.

For mineral oils, the cleanliness level of environmentally acceptable hydraulic fluids is given as a three-digit numerical code in accordance with ISO 4406. This numerical code denotes the number of particles present in a hydraulic fluid for a defined quantity. Moreover, foreign solid matter is not to exceed a mass of 50 mg/kg (gravimetric examination according to ISO 4405).

In general, compliance with a minimum cleanliness level of 20/18/15 in accordance with ISO 4406 or better is to be maintained in operation. Special servo valves demand improved cleanliness levels of at least 18/16/13. A reduction in cleanliness level by one level means half of the quantity of particles and thus greater cleanliness. Lower numbers in cleanliness levels should always be striven for and extend the service life of hydraulic components. The component with the highest cleanliness requirements determines the required cleanliness of the overall system. Please also observe the specifications in table 1: "Cleanliness levels according to ISO 4406" and in the respective data sheets of the various hydraulic components.

Hydraulic fluids frequently fail to meet these cleanliness requirements on delivery. Careful filtering is therefore required during operation and in particular, during filling in order to ensure the required cleanliness levels. Your lubricant manufacturer can tell you the cleanliness level of hydraulic fluids as delivered. To maintain the required cleanliness level over

the operating period, you must use a reservoir breather filter. If the environment is humid, take appropriate measures, such as a breather filter with air drying or permanent off-line water separation.

Note: the specifications of the lubricant manufacturer relating to cleanliness levels are based on the time at which the container concerned is filled and not on the conditions during transport and storage.

Further information about contamination with solid matter and cleanliness levels can be found in brochure RE 08016.

Table 1: Cleanliness levels according to ISO 4406

Particles per 100 ml		Scale number	
More than	Up to and including		
8,000,000	16,000,000	24	
4,000,000	8,000,000	23	
2,000,000	4,000,000	22	
1,000,000	2,000,000	21

3 Selection of the hydraulic fluid

Environmentally acceptable hydraulic fluids for Bosch Rexroth hydraulic components are assessed on the basis of their fulfillment of the minimum requirements of ISO 15380.

3.1 Selection criteria for the hydraulic fluid

The specified limit values for all components employed in the hydraulic system, for example viscosity and cleanliness level, must be observed with the hydraulic fluid used, taking into account the specified operating conditions.

Hydraulic fluid suitability depends, amongst others, on the following factors:

3.1.1 Viscosity

Viscosity is a basic property of hydraulic fluids. The permissible viscosity range of complete systems needs to be determined taking account of the permissible viscosity of all components and it is to be observed for each individual component.

The viscosity at operating temperature determines the response characteristics of closed control loops, stability and damping of systems, the efficiency factor and the degree of wear.

We recommend that the optimum operating viscosity range of each component be kept within the permissible temperature range. This usually requires either cooling or heating, or both. The permissible viscosity range and the necessary cleanliness level can be found in the product data sheet for the component concerned.

If the viscosity of a hydraulic fluid used is above the permitted operating viscosity, this will result in increased hydraulic-mechanical losses. In return, there will be lower internal leakage losses. If the pressure level is lower, lubrication gaps may not be filled up, which can lead to increased wear. For hydraulic pumps, the permitted suction pressure may not be reached, which may lead to cavitation damage.

If the viscosity of a hydraulic fluid is below the permitted operating viscosity, increased leakage, wear, susceptibility to contamination and a shorter life cycle will result.

Please ensure that the permissible temperature and viscosity limits are observed for the respective components. This usually requires either cooling or heating, or both.

3.1.2 Viscosity-temperature behavior

For hydraulic fluids, the viscosity temperature behavior (V-T behavior) is of particular importance. Viscosity is characterized in that it drops when the temperature increases and rises when the temperature drops. The interrelation between viscosity and temperature is described by the viscosity index (VI).

If exposed to the cold for several days, viscosity may rise significantly (HETG and HEES). After heating, the characteristic values as specified on the data sheet are restored. Please ask your lubricant manufacturer for the "Flow capacity after 7 days at low temperature" (ASTM D 2532) of fluid classifications HETG and partially saturated HEES.

All known environmentally acceptable hydraulic fluids have better viscosity temperature behavior than mineral oil HLP and generally feature greater shear stability than HVLP mineral oils. This should be taken into consideration when selecting hydraulic fluid for the required temperature range. A lower viscosity level can frequently be used to save any drive power during a cold start and avoid viscosity being too low at higher temperatures. The required viscosity and temperature limits in the product data sheets are to be observed in all operating conditions.

Depending on the basic fluid types/classes, VI indices can be achieved of 140–220, see Fig. 1: "Examples: V-T diagrams in comparison to HLP (reference values)" and Table 4: "Classification and fields of application of environmentally acceptable hydraulic fluids".

Fig. 1: Examples V-T diagrams in comparison to HLP (reference values, double-logarithmic representation)

Detailed V-T diagrams may be obtained from your lubricant manufacturer for their specific products.

3.1.3 Wear protection capability

Wear protection capability describes the property of hydraulic fluids to prevent or minimize wear within the components. The wear protection capability is described in ISO 15380 via test procedures "FZG gear test rig" (ISO 14635-1) and "Mechanical test in the vane pump" (ISO 20763). From ISO VG 32, ISO 15380 prescribes a rating of at least 10 (FZG test). At present, the FZG test cannot be applied to viscosity classes < ISO VG 32. The wear protection capability of environmentally acceptable hydraulic fluids in relation to the two test procedures is comparable to that of mineral oil HLP/HVLP.

3.1.4 Material compatibility

The hydraulic fluid must not negatively affect the materials used in the components. Compatibility with coatings, seals, hoses, metals and plastics is to be observed in particular. The fluid classifications specified in the respective component data sheets are tested by the manufacturer with regard to material compatibility. Parts and components not supplied by us are to be checked by the user.

Table 2: Known material incompatibilities

Classification	Incompatible with:
HE... general	<p>One-component color coatings, lead, galvanized zinc coatings, some non-ferrous metals, seals made of NBR. In some cases, the latter show major increases in volume when impermissibly aged hydraulic fluids come into contact with the material. NBR is only permitted by prior consent, please observe the customary seal and tube replacement intervals. Do not use any hydrolysis/susceptible polyurethane qualities.</p> <p>Note Please check seals and coatings of control cabinets, outer coatings of hydraulic components and accessories (connectors, cables, control cabinets) for resistance to vapors issuing from hydraulic fluids.</p>
HETG/HEES	Zinc, some non-ferrous alloys with zinc
HEPG	<p>Steel/aluminum tribocontacts, paper filters, polymethylmethacrylate (PMMA), NBR</p> <p>Note Check plastics for resistance</p>

The material incompatibilities mentioned here do not automatically result in function problems. However the elements of the materials are found in the hydraulic fluids after use. The biological degradation of hydraulic fluids is negatively influenced.

3.1.5 Aging resistance

The way an environmentally acceptable hydraulic fluids ages depends on the thermal, chemical and mechanical stress to which it is subjected. The influence of water, air, temperature and contamination may be significantly greater than for mineral oils HLP/HVLP. Aging resistance can be greatly influenced by the chemical composition of the hydraulic fluids .

High fluid temperatures (e.g. over 80 °C) result in an approximate halving of the fluid service life for every 10 °C temperature increase and should therefore be avoided. The halving of the fluid service life results from the application of the Arrhenius equation (see Glossary).

Table 3: Reference values for temperature-dependent aging of the hydraulic fluid

Reservoir temperature	Fluid life cycle
80 °C	100 %
90 °C	50 %
100 °C	25 %

A modified aging test (without adding water) is prescribed for fluid classifications HETG and HEES. Hydraulic fluids with HEPG and HEPR classification are subjected to the identical test procedure as mineral oils (with 20 % water added). The calculated fluid service life is derived from the results of tests in which the long-term characteristics are simulated in a short period of time by applying more arduous conditions (condensed testing). This calculated fluid service life is not to be equated to the fluid service life in real-life applications.

Table 3 is a practical indicator for hydraulic fluids with water content < 0.1%, cf. chapter 4.10. "Water".

3.1.6 Biological degradation

Environmentally acceptable hydraulic fluids are ones which degrade biologically much faster than mineral oils. Biological degradation is a biochemical transformation effected by micro-organisms resulting in mineralization. For environmentally acceptable hydraulic fluids that make reference to ISO 15380, biological degradation according to ISO 14593 or ISO 9439 must be verified. 60% minimum degradation is defined as limit value. Proof of biological degradation is furnished for the new, unmixed, ready-formulated hydraulic fluids. Aged or mixed hydraulic fluids are less able to degrade biologically. Biological degradation outside the defined test procedure is subject to a variety of natural influences. The key factors are temperature, humidity, contamination, fluid concentration, type and quantity of micro-organisms. Environmentally acceptable hydraulic fluids require no extended maintenance in comparison to mineral oils, please observe chapter 4 "Hydraulic fluids in operation".

3.1.7 Air separation ability (ASA)

The air separation ability (ASA) describes the property of a hydraulic fluid to separate undissolved air. Hydraulic fluids always contain dissolved air. During operation, dissolved air may be transformed into undissolved air, leading to cavitation damages. Fluid classification, fluid product, reservoir size and design must be coordinated to take into account the dwell time and ASA value of the hydraulic fluid. The air separation capacity depends on the viscosity, temperature, basic fluid and aging. It cannot be improved by additives.

According to ISO 15380, for instance, an ASA value ≤ 10 minutes is required for viscosity class ISO VG 46, 6 minutes are typical, lower values are preferable.

3.1.8 Demulsifying ability and water solubility

The capacity of a hydraulic fluid to separate water at a defined temperature is known as the demulsifying ability. ISO 6614 defines the demulsifying properties of hydraulic fluids.

Fluids classified HETG, HEES and HEPR separate from water. HETG and HEES hydraulic fluids have a different water separation ability to mineral oil HLP/HVLP. At 20 °C, in comparison to mineral oil HLP/HVLP, a multiple ($>$ factor 3) of water can separate in the hydraulic fluid. Water solubility is also more temperature-dependent than for mineral oils. With regard to water solubility, HEPR hydraulic fluids behave like HVLP hydraulic fluids (see RE 90220). In the majority of cases, HEPG-classified fluids HEPG dissolve water completely, see chapter "4.10 Water".

3.1.9 Filterability

Filterability describes the ability of a hydraulic fluid to pass through a filter, removing solid contaminants. The hydraulic fluids used require a good filterability, not just when new, but also during the whole of their service life. Depending on the different basic fluids (glycols, saturated and partially saturated ester oils, hydrocrack oils, polyalpha olefins, triglycerides) and additives (VI enhancers), there are great differences here.

The filterability is a basic prerequisite for cleanliness, servicing and filtration of hydraulic fluids. Rexroth therefore requires the same degree of filterability of environmentally acceptable hydraulic fluids as for mineral oils HLP/HVLP to DIN 51524. As ISO 15380 does not comment on the filterability of hydraulic fluids, filterability comparable to that of mineral oils HLP/HVLP must be requested of lubricant manufacturers.

Filterability is tested with the new hydraulic fluid and after the addition of 0.2 % water. The underlying standard (ISO 13357-1/-2) stipulates that filterability must have no negative effects on the filters or the hydraulic fluid, see chapter 4 "Hydraulic fluids in operation".

3.1.10 Corrosion protection

Hydraulic fluids should not just prevent corrosion formation on steel components, they must also be compatible with non-ferrous metals and alloys. Corrosion protection tests on different metals and metal alloys are described in ISO 15380. Hydraulic fluids that are not compatible with the materials listed above must not be used, even if they are compliant with ISO 15380.

Rexroth components are usually tested with HLP hydraulic fluids or corrosion protection oils based on mineral oils before they are delivered.

3.1.11 Additivation

The properties described above can be modified with the help of suitable additives. Environmentally acceptable hydraulic fluids should never contain heavy metals. According to the present state of knowledge, all hydraulic fluids, regardless of additivation, can be filtered with all customary filter materials in all known filtration ratings ($\geq 0.8 \mu\text{m}$), without filtering out effective additives at the same time.

Bosch Rexroth does not prescribe any specific additive system.

3.2 Classification and fields of application

Table 4: Classification and fields of application

Classification	Features	Typical field of application	Notes
<p>HEPG according to ISO 15380</p> <p>Density at 15 °C: typically > 0.97 kg/dm³</p> <p>VI: typical > 170</p>	Basic fluid, glycols	Systems on exposed water courses (locks, weirs, dredgers)	<p>For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <ul style="list-style-type: none"> – Very good viscosity/temperature characteristics, shear stability – Resistant to aging – Incompatible with mineral oil (exceptions must be confirmed by the lubricant manufacturer) – Can be water-soluble – Can be mixed with water – Very good wear protection properties – A higher implementation temperature with the same viscosity in comparison to mineral oil is to be expected – Due to the higher density in comparison to HLP, lower suction pressures are to be anticipated for pumps. Reduce the maximum speed as required and optimize suction conditions. – Classified as insignificantly water-endangering (water hazard class WGK 1) – Prior to commissioning, contact the lubricant manufacturer, as the components are tested with mineral oil HLP/corrosion protection oil.
<p>HEES partially saturated according to ISO 15380</p> <p>Density at 15 °C: typically 0.90–0.93 kg/dm³</p> <p>VI: typical > 160</p> <p>Iodine count < 90</p>	Basic fluid: Ester based on renewable raw materials, synthetic esters, mixtures of various esters, mixtures with polyalphaolefines (< 30%)	Suitable for most fields of application and components.	<p>For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <ul style="list-style-type: none"> – Preferred use of FKM seals. Please enquire for shaft seal rings and implementation temperatures under –15 °C. – In operation, a higher temperature in comparison to mineral oil HLP/HVLP is to be expected given identical design and viscosity – Limit lower (depending on viscosity class) and upper implementation temperatures (maximum 80 °C due to aging) – Good viscosity/temperature characteristics, shear stability. – Good corrosion protection, if correspondingly additivized – Mostly classed as insignificantly water-endangering (water hazard class WGK 1), in some cases as not water-endangering – High dirt dissolving capacity on fluid changeovers – In unfavorable operating conditions (high water content, high temperature), HEES on ester basis have a tendency to hydrolysis. The acidic organic decomposition products can chemically attack materials and components.

Continued on page 9

Table 4: Classification and fields of application (continued from page 8)

Classification	Features	Typical field of application	Notes
<p>HEES saturated according to ISO 15380</p> <p>Density at 15 °C: typically 0.90–0.93 kg/dm³</p> <p>VI: typical 140–160</p> <p>Iodine count <15</p>	<p>Basic fluid: Ester based on renewable raw materials, synthetic esters, mixtures of various esters, mixtures with polyalphaolefines (< 30%)</p>	<p>Suitable for most fields of application and components. Saturated HEES should be preferred over partially saturated HEES and HETG for components and systems exposed to high stress levels.</p>	<p>For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <ul style="list-style-type: none"> – Preferred use of FKM seals. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <ul style="list-style-type: none"> – Behaves similarly to HVLP- hydraulic fluids, individual products comply with ISO 15380 HEPR and DIN 51524-3 HVLP – Preferred use of FKM seals. Please enquire for shaft seal rings and implementation temperatures under –15 °C. – Good viscosity-temperature behavior – Classified as insignificantly water-endangering (water hazard class WGK 1) <p>Note: Note shear stability (see chapter 4.11 "Fluid servicing, fluid analysis and filtration" and chapter 6 "Glossary")</p>
<p>HETG according to ISO 15380</p> <p>Density at 15 °C: typically 0.90-0.93 kg/dm³</p> <p>VI: typical > 200</p> <p>Iodine count > 90</p>	<p>Basic fluid: vegetable oils and triglycerides</p>	<p>Not recommended for Rexroth components!</p>	<p>Practical requirements are frequently not fulfilled by hydraulic fluids in this classification. Use only permissible after consultation.</p> <ul style="list-style-type: none"> – Viscosity is not stable over time – Very fast fluid aging, very hydrolysis-susceptible (please observe neutralization number) – Tendency to gumming, gelling and setting. – Limit the lower (depending on viscosity class) and upper implementation temperatures (see chapter 3.1.5) – Only limited material compatibility – Filterability problems at water ingress – High dirt dissolving capacity on fluid changeovers – Mostly classed as not water-endangering

4 Hydraulic fluids in operation

4.1 General

The properties of hydraulic fluids can change continually during storage and operation.

Please note that the fluid standard ISO 15380 merely describes minimum requirements for hydraulic fluids in new condition at the time of filling into the bins. The operator of a hydraulic system must ensure that the hydraulic fluid remains in a utilizable condition throughout its entire period of use.

Deviations from the characteristic values are to be clarified with the lubricant manufacturer, the test labs or Bosch Rexroth.

Bosch Rexroth will accept no liability for damage to its components within the framework of the applicable liability legislation insofar as the latter is due to non-observance of the following instructions.

Please note the following aspects in operation.

4.2 Storage and handling

Hydraulic fluids must be stored correctly in accordance with the instructions of the lubricant manufacturer. Avoid exposing the containers to lengthy periods of direct heat. Containers are to be stored in such a way that the risk of any foreign liquid or solid matter (e.g. water, foreign fluids or dust) ingress into the inside of the container can be ruled out. After taking hydraulic fluids from the containers, these are immediately to be properly resealed.

Recommendation:

- Store containers in a dry, roofed place
- Store barrels on their sides
- Clean reservoir systems and machine reservoirs regularly

4.3 Filling of new systems

Usually, the cleanliness levels of the hydraulic fluids as delivered do not meet the requirements of our components. Hydraulic fluids must be filtered using an appropriate filter system to minimize solid particle contamination and water in the system.

As early as possible during test operation, new systems should be filled with the selected hydraulic fluid so as to reduce the risk of accidentally mixing fluids (see chapter 4.5 "Mixing and compatibility of different hydraulic fluids"). Changing the hydraulic medium at a later point represents significant additional costs (see following chapter).

4.4 Hydraulic fluid changeover

In particular with the changeover from mineral oils to environmentally acceptable hydraulic fluids, but also from one environmentally acceptable hydraulic fluids to another, there may be interference (e.g. incompatibility in the form of gelling, silting, stable foam or reduced filterability or filter blockage).

In the case of changeovers of the fluid in hydraulic systems, it is important to ensure compatibility of the new hydraulic fluid with the remains of the previous hydraulic fluid. Bosch Rexroth recommends obtaining verification of compatibility from the

manufacturer or supplier of the new hydraulic fluid. The quantity of old fluid remaining should be minimized. Mixing hydraulic fluids should be avoided, see following chapter.

For information on changing over hydraulic fluids with different classifications, please refer to VDMA 24314, VDMA 24569 and ISO 15380 appendix A.

Bosch Rexroth will not accept liability for any damage to its components resulting from inadequate hydraulic fluid changeovers!

4.5 Mixing and compatibility of different hydraulic fluids

If hydraulic fluids from different manufacturers or different types from the same manufacturer are mixed, gelling, silting and deposits may occur. These, in turn, may cause foaming, impaired air separation ability, malfunctions and damage to the hydraulic system.

If the fluid contains more than 2 % of another fluid then it is considered to be a mixture. Exceptions apply for water, see chapter 4.10 "Water".

Mixing with other hydraulic fluids is not generally permitted. This also includes hydraulic fluids with the same classification and from the market overview RE 90221-01. If individual lubricant manufacturers advertise miscibility and/or compatibility, this is entirely the responsibility of the lubricant manufacturer.

Bosch Rexroth customarily tests all components with mineral oil HLP before they are delivered.

Note: With connectible accessory units and mobile filtering systems, there is a considerable risk of non-permitted mixing of the hydraulic fluids!

Rexroth will not accept liability for any damage to its components resulting from mixing hydraulic fluids!

4.6 Re-additivation

Additives added at a later point in time such as colors, wear reducers, VI enhancers or anti-foam additives, may negatively affect the performance properties of the hydraulic fluid and the compatibility with our components and therefore are not permissible.

Rexroth will not accept liability for any damage to its components resulting from re-additivation!

4.7 Foaming behavior

Foam is created by rising air bubbles at the surface of hydraulic fluids in the reservoir. Foam that develops should collapse as quickly as possible.

Common hydraulic fluids in accordance with ISO 15380 are sufficiently inhibited against foam formation in new condition. On account of aging and adsorption onto surfaces, the defoamer concentration may decrease over time, leading to a stable foam.

Defoamers may be re-dosed only after consultation with the lubricant manufacturer and with his written approval.

Defoamers may affect the air separation ability.

4.8 Corrosion

The hydraulic fluid is to guarantee sufficient corrosion protection of components under all operating conditions, even in the event of impermissible water contamination.

Environmentally acceptable hydraulic fluids are tested for corrosion protection in the same way as mineral oil HLP/HVLP. When used in practice other corrosion mechanisms are revealed in detail and in individual cases, for the most part in contact with non-ferrous and white alloys.

4.9 Air

Under atmospheric conditions the hydraulic fluid contains dissolved air. In the negative pressure range, for instance in the suction pipe of the pump or downstream of control edges, this dissolved air may transform into undissolved air. The undissolved air content represents a risk of cavitation and of the diesel effect. This results in material erosion of components and increased hydraulic fluid aging.

With the correct measures, such as suction pipe and reservoir design, and an appropriate hydraulic fluid, air intake and separation can be positively influenced.

See also chapter 3.1.7 "Air separation ability (ASA)".

4.10 Water

Water contamination in hydraulic fluids can result from direct ingress or indirectly through condensation of water from the air due to temperature variations.

HEPG dissolves water completely. This means that any water that has ingressed into the system cannot be drained off in the sump of the reservoir.

In the case of hydraulic fluids classed HETG, HEES and HEPR undissolved water can be drained off from the reservoir sump, the remaining water content is however too high to ensure that the maximum permissible water limit values are observed in the long term.

Water in the hydraulic fluid can result in wear or direct failure of hydraulic components. Furthermore, a high water content in the hydraulic fluid negatively affects aging and filterability and increases susceptibility to cavitation. During operation, the water content in all hydraulic fluids, determined according to the "Karl Fischer method" (see chapter 6 "Glossary") for all environmentally acceptable hydraulic fluids must constantly be kept below 0.1% (1000 ppm). To ensure a long service life of both hydraulic fluids and components, Bosch Rexroth recommends that values below 0.05% (500 ppm) are permanently maintained.

Due to the higher water solubility (except for HEPR) in comparison to mineral oil HLP/HVLP it is urgently advised that precautions be taken when using environmentally acceptable hydraulic fluids, such as a dehumidifier on the reservoir ventilation.

Water content has an affect particularly in the case of HETG and partially saturated HEES in that it accelerates aging (hydrolysis) of the hydraulic fluid and biological degradation, see chapter 4.11 "Fluid servicing, fluid analysis and filtration".

4.11 Fluid servicing, fluid analysis and filtration

Air, water, operating temperature influences and solid matter contamination will change the performance characteristics of hydraulic fluids and cause them to age.

To preserve the usage properties and ensure a long service life for hydraulic fluid and components, the monitoring of the fluid condition and a filtration adapted to the application requirements (draining and degassing if required) are indispensable.

The effort is higher in the case of unfavorable usage conditions, increased stress for the hydraulic system or high expectations as to availability and service life, see chapter 2 "Solid particle contamination and cleanliness levels".

When commissioning a system, please note that the required minimum cleanliness level can frequently be attained only by flushing the system. Due to severe start-up contamination, it may be possible that a fluid and/or filter replacement becomes necessary after a short operating period (< 50 operating hours).

The hydraulic fluid must be replaced at regular intervals and tested by the lubricant manufacturer or recognized accredited test labs. **We recommend a reference analysis after commissioning.**

The minimum data to be tested for analyses are:

- Viscosity at 40 °C and 100 °C
- Neutralization number NN (acid number AN)
- Water content (Karl-Fischer method)
- Particle measurement with evaluation according to ISO 4406 or mass of solid foreign substances with evaluation to EN 12662
- Element analysis (RFA (EDX) / ICP, specify test method)
- Comparison with new product or available trend analyses
- Assessment / evaluation for further use
- Also recommended: IR spectrum"

Differences in the maintenance and upkeep of environmentally acceptable hydraulic fluids with the corresponding suitability characteristics (as required in market overview RE 90221-01) in comparison to mineral oil HLP/HVLP are not necessary. Attention is however drawn to the note in chapter 1.3.

After changing over hydraulic fluids it is recommended that the filters be replaced again after 50 operating hours as fluid aging products may have detached themselves ("self-cleaning effect").

Compared to the pure unused hydraulic fluid the changed neutralization number NN (acid number AN) indicates how many aging products are contained in the hydraulic fluid. This difference must be kept as low as possible. As soon as the trend analysis notes a significant increase in the values, the lubricant manufacturer should be contacted.

A higher viscosity than that of new materials indicates that the hydraulic fluid has aged. Evaluation by the test lab or lubricant manufacturers is however authoritative, whose recommendation should be urgently observed.

On systems where the possibility of water contamination cannot be completely ruled out (also condensation), it should be ensured via the hydraulic system circuit that fluid aging products are not accumulating in individual areas of the hydraulic system, but are being removed from the system in a controlled manner via the filtration system. This should be ensured via suitable hydraulic circuits (e.g. flushing circuit) or system manufacturer's operating instructions/specifications.

In case of warranty, liability or guarantee claims to Bosch Rexroth, service verification and/or the results of fluid analyses are to be provided.

5 Disposal and environmental protection

All environmentally acceptable hydraulic fluids, are like mineral oil-based hydraulic fluids, subject to special disposal obligations.

The respective lubricant manufacturers provide specifications on environmentally acceptable handling and storage. Please ensure that spilt or splashed fluids are absorbed with appropriate adsorbents or by a technique that prevents it contaminating water courses, the ground or sewerage systems.

It is also not permitted to mix fluids when disposing of hydraulic fluids. Regulations governing the handling of used oils stipulate that used oils are not to mixed with other products, e.g. substances containing halogen. Non-compliance will increase disposal costs. Comply with the national legal provisions concerning the disposal of the corresponding hydraulic fluid. Comply with the local safety data sheet of the lubricant manufacturer for the country concerned.

6 Glossary

Additivation

Additives are chemical substances added to the basic fluids to achieve or improve specific properties.

Aging

Hydraulic fluids age due to oxidation (see chapter 3.1.5 "Aging resistance"). Liquid and solid contamination acts as a catalyzer for aging, meaning that it needs to be minimized as far as possible by careful filtration. Please refer to Hydrolysis.

Arrhenius equation

The quantitative relation between reaction rate and temperature is described by an exponential function, the Arrhenius equation. This function is usually visualized within the typical temperature range of the hydraulic system. For a practical example, see chapter 3.1.5 "Aging resistance".

Basic fluids

In general, a hydraulic fluid is made up of a basic fluid, or base oil, and chemical substances, the so-called additives. The proportion of basic fluid is generally greater than 90%.

Diesel effect

If hydraulic fluid that contains air bubbles is compressed quickly, the bubbles are heated to such a degree that a self-ignition of the air-gas mix may occur. The resultant temperature increase may lead to seal damage and increased aging of the hydraulic fluid.

Saturated esters

Esters differ by the number of C atoms (chain length) and position of the bonds between the C atoms. Saturated esters do not have double/multiple bonds between C atoms and are therefore more resistant to aging than partially saturated esters.

Partially saturated esters

In contrast to saturated esters, partially saturated esters have double/multiple bonds between C atoms. Rexroth defines partially saturated esters as unsaturated bonds and mixtures of esters with unsaturated and saturated bonds. Esters with unsaturated bonds are produced on the basis of renewable raw materials.

Depending on their number and position, these unsaturated bonds between the C atoms are instable. These bonds can detach themselves and form new bonds, thus changing the properties of those liquids (an aging mechanism). One of the underlying requirements for inclusion in the market overview RE 90221-01 is an aging stability characteristic. Attention is however drawn to the note in chapter 1.3.

Hydrolysis

Hydrolysis is the splitting of a chemical bond through the reaction with water under the influence of temperature.

ICP (atomic emission spectroscopy)

The ICP procedure can be used to determine various wear metals, contamination types and additives. Practically all elements in the periodic system can be detected with this method..

Iodine count

The iodine count is a yardstick for the quantity of single and multiple unsaturated bonds between C atoms in the basic fluid. A low iodine count indicates that the hydraulic fluid contains few unsaturated bonds and is thus considerably more resistant to aging than a hydraulic fluid with a high iodine count. A statement about the position at which these multiple bonds are located and about how "stable" they are against influencing factors cannot be derived simply by stating the iodine count.

Karl Fischer method

Method to determine the water content in fluids. Indirect coulometric determination procedure in accordance with DIN EN ISO 12937 in connection with DIN 51777-2. Only the combination of both standards will assure adequately accurate measured values. For hydraulic fluids based on glycol, DIN EN ISO 12937 is to be applied in conjunction with DIN 51777-1.

Cavitation

Cavitation is the creation of cavities in fluids due to pressure reduction below the saturated vapour pressure and subsequent implosion when the pressure increases. When the cavities implode, extremely high acceleration, temperatures and pressure may occur temporarily, which may damage the component surfaces.

Neutralization number (NN)

The neutralization number (NN) or acid number (AN) specifies the amount of caustic potash required to neutralize the acid contained in one gram of fluid.

Pour point

The lowest temperature at which the fluid still just flows when cooled down under set conditions. The pour point is specified in the lubricant manufacturers' technical data sheets as a reference value for achieving this flow limit.

RFA (wavelength dispersive x-ray fluorescence analysis)

Is a procedure to determine nearly all elements in liquid and solid samples with nearly any composition. This analysis method is suitable for examining additives and contamination, delivering fast results.

Shearing/shear loss

Shearing of molecule chains during operation can change the viscosity of hydraulic fluids with long chain VI enhancers. The initially high viscosity index drops. This needs to be taken into account when selecting the hydraulic fluid.

The only value at present that can be used to assess viscosity changes in operation is the result of the test in accordance with DIN 51350 part -6. Please note that there are practical applications that create a much higher shear load on such hydraulic fluids than can be achieved by this test.

Stick-slip

Interaction between a resilient mass system involving friction (such as cylinder + oil column + load) and the pressure increase at very low sliding speeds. The static friction of the system is a decisive value here. The lower it is, the lower the speed that can still be maintained without sticking. Depending on the tribologic system, the stick-slip effect may lead to vibrations generated and sometimes also to significant noise emission. In many cases, the effect can be attenuated by replacing the lubricant.

Viscosity

Viscosity is the measure of the internal friction of a fluid to flow. It is defined as the property of a substance to flow under tension. Viscosity is the most important characteristic for describing the load-bearing capacity of a hydraulic fluid.

Kinematic viscosity is the ratio of the dynamic viscosity and the density of the fluid; the unit is mm²/s. Hydraulic fluids are classified by their kinematic viscosity into ISO viscosity classes. The reference temperature for this is 40 °C.

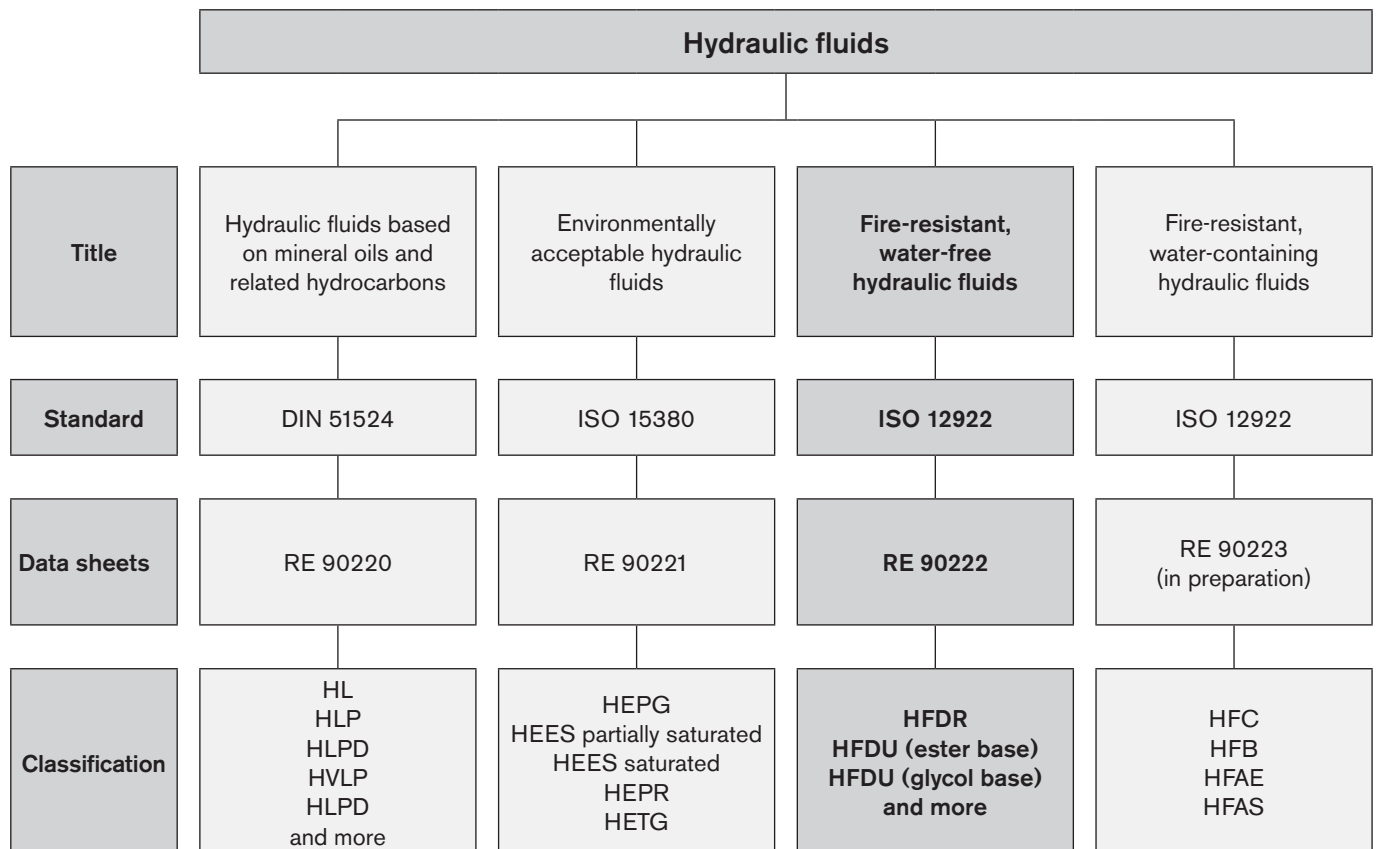

Viscosity index (VI)

Refers to the viscosity temperature behavior of a fluid. The lower the change of viscosity in relation the temperature, the higher the VI.

1 Basic information

1.1 General instructions

The hydraulic fluid is the common element in any hydraulic component and must be selected very carefully. Quality and cleanliness of the hydraulic fluid are decisive factors for the operational reliability, efficiency and service life of a system.

Hydraulic fluids must conform, be selected and used in accordance with the generally acknowledged rules of technology and safety provisions. Reference is made to the country-specific standards and directives (in Germany the directive of the Employer's Liability Insurance Association BGR 137).

This data sheet includes recommendations and regulations concerning the selection, operation and disposal of fire-resistant, water-free hydraulic fluids in the application of Rexroth hydraulic components.

The individual selection of hydraulic fluid or the choice of classification are the responsibility of the operator.

It is the responsibility of the user to ensure that appropriate measures are taken for safety and health protection and to ensure compliance with statutory regulations. The recommendations of the lubricant manufacturer and the specifications given in the safety data sheet are to be observed when using hydraulic fluid.

This data sheet does not absolve the operator from verifying the conformity and suitability of the respective hydraulic fluid for his system. He is to ensure that the selected fluid meets the minimum requirements of the relevant hydraulic fluid standard during the whole of the period of use.

The currently valid standard for fire-resistant hydraulic fluids is the ISO 12922. In addition, other, more detailed documents, guidelines, specifications and legislation may also be valid. The operator is responsible for ensuring that such regulations are observed, for example:

- 7th Luxembourg Report: Luxembourg, April 1994, Doc. No. 4746/10/91 EN "Requirements and tests applicable to fire-resistant hydraulic fluids for hydrostatic and hydrokinetic power transmission and control"
- VDMA 24314 (1981-11): "Changing hydraulic fluids – guidelines"
- VDMA 24317 (2005-11): "Fire-resistant hydraulic fluids – minimum technical requirements"
- FM Approval Standard 6930 (2009-04): "Flammability Classification of Industrial Fluids" (only available in English)
- DIN Technical Report CEN/TR 14489 (2006-01): "Selection guidelines for protecting safety, health and the environment"

We recommend that you maintain constant, close contact with lubricant manufacturers to support you in the selection, maintenance, care and analyses.

When disposing of used hydraulic fluids, apply the same care as during use.

1.2 Fire resistance

There is no clear legal definition of fire-resistant hydraulic fluids. There are great differences regarding fire resistance. The selection is the sole responsibility of the system operator with respect to requirements (application, construction and design of the system, hottest source in the system, necessary fire protection).

Different test procedures are applied for evaluating fire resistance.

Fire resistance test procedure according to ISO 12922:

- Ignition properties of spray according to ISO 15029-1 (Spray flame persistence – hollow-cone nozzle method)
- Ignition properties of spray according to ISO 15029-2 (Stabilized flame heat release)
- Wick flame persistence of fluids according to ISO 14935 (average flame persistence)
- Determination of the flammability characteristics of fluids in contact with hot surfaces, ignition process according to ISO 20823 (ignition temperature, flame spread)

In general, fire-resistant hydraulic fluids are distinguished between **water-containing** fire-resistant and **water-free** fire-resistant hydraulic fluids. Water-containing fire-resistant hydraulic fluids are described in RE 90223.

Water-free, fire-resistant hydraulic fluid means hydraulic fluids with a water-proportion of 0.1% by volume ("Karl Fischer method", see chapter 6 "Glossary"), measured at the time of filling in the transport container.

In Europe water-free, fire-resistant hydraulic fluids are not approved for use in underground coal mining. The classification HFDU is no longer included in the VDMA 24317: 2005.

Note

In contrast to water-containing fluids, all water-free, fire-resistant hydraulic fluids have a flash point and a fire point. Specific parameters for flash point and fire point can be found in the technical and/or safety data sheet for the hydraulic fluid concerned.

Just as much care should be taken when working with fire-resistant hydraulic fluids as with other hydraulic fluids, e.g. mineral oils. A leak from the hydraulic system must be avoided. The best and most cost-effective protection against fire and explosion is to prevent leakage with meticulous service, maintenance and care of the hydraulic system.

1.3 Scope

This data sheet must be applied when using water-free, fire-resistant hydraulic fluids with Rexroth hydraulic components. The specifications of this data sheet may be further restricted by the specifications given in data sheets for the individual components concerned.

The use of the individual water-free, fire-resistant hydraulic fluids in accordance with the intended purpose can be found in the safety data sheets or other product description documents of the lubricant manufacturers. In addition, each use is to be individually considered.

Rexroth hydraulic components may only be operated with water-free, fire-resistant hydraulic fluids according to ISO 12922 if specified in the respective component data sheet or if a Rexroth approval for use is furnished.

The manufacturers of hydraulic systems must adjust their systems and operating instructions to the water-free, fire-resistant hydraulic fluids.

Bosch Rexroth will accept no liability for its components for any damage resulting from failure to comply with the notes below.

1.4 Safety instructions

Hydraulic fluids can constitute a risk for persons and the environment. These risks are described in the hydraulic fluid safety data sheets. The operator is to ensure that a current safety data sheet for the hydraulic fluid used is available and that the measures stipulated therein are complied with.

2 Solid particle contamination and cleanliness levels

Solid particle contamination is the major reason for faults occurring in hydraulic systems. It may lead to a number of effects in the hydraulic system. Firstly, single large solid particles may lead directly to a system malfunction, and secondly small particles cause continuous elevated wear.

For mineral oils, the cleanliness level of water-free, fire-resistant hydraulic fluids is given as a three-digit numerical code in accordance with ISO 4406. This numerical code denotes the number of particles present in a hydraulic fluid for a defined quantity. Moreover, foreign solid matter is not to exceed a mass of 50 mg/kg (gravimetric examination according to ISO 4405).

In general, compliance with a minimum cleanliness level of 20/18/15 in accordance with ISO 4406 or better is to be maintained in operation. Special servo valves demand improved cleanliness levels of at least 18/16/13. A reduction in cleanliness level by one level means half of the quantity of particles and thus greater cleanliness. Lower numbers in cleanliness levels should always be striven for and extend the service life of hydraulic components. The component with the highest cleanliness requirements determines the required cleanliness of the overall system. Please also observe the specifications in table 1: "Cleanliness levels according to ISO 4406" and in the respective data sheets of the various hydraulic components.

Hydraulic fluids frequently fail to meet these cleanliness requirements on delivery. Careful filtering is therefore required during operation and in particular, during filling in order to ensure the required cleanliness levels. Your lubricant manufacturer can tell you the cleanliness level of hydraulic fluids as delivered. To maintain the required cleanliness level over the operating period, you must use a reservoir breather filter. If the environment is humid, take appropriate measures, such as a breather filter with air drying or permanent off-line water separation.

Note: the specifications of the lubricant manufacturer relating to cleanliness levels are based on the time at which the container concerned is filled and not on the conditions during transport and storage.

Further information about contamination with solid matter and cleanliness levels can be found in brochure RE 08016.

Table 1: Cleanliness levels according to ISO 4406

Particles per 100 ml		Scale number
More than	Up to and including	
8,000,000	16,000,000	24
4,000,000	8,000,000	23
2,000,000	4,000,000	22
1,000,000	2,000,000	21
500,000	1,000,000	20
250,000	500,000	19
130,000	250,000	18
64,000	130,000	17
32,000	64,000	16
16,000	32,000	15
8,000	16,000	14
4,000	8,000	13
2,000	4,000	12
1,000	2,000	11
500	1,000	10

 > 4 µm > 6 µm > 14 µm

3 Selection of the hydraulic fluid

Water-free, fire-resistant hydraulic fluids for Bosch Rexroth hydraulic components are assessed on the basis of their fulfillment of the minimum requirements of ISO 12922.

3.1 Selection criteria for the hydraulic fluid

The specified limit values for all components employed in the hydraulic system, for example viscosity and cleanliness level, must be observed with the hydraulic fluid used, taking into account the specified operating conditions.

Hydraulic fluid suitability depends, amongst others, on the following factors:

3.1.1 Viscosity

Viscosity is a basic property of hydraulic fluids. The permissible viscosity range of complete systems needs to be determined taking account of the permissible viscosity of all components and it is to be observed for each individual component.

The viscosity at operating temperature determines the response characteristics of closed control loops, stability and damping of systems, the efficiency factor and the degree of wear.

We recommend that the optimum operating viscosity range of each component be kept within the permissible temperature range. This usually requires either cooling or heating, or both. The permissible viscosity range and the necessary cleanliness level can be found in the product data sheet for the component concerned.

If the viscosity of a hydraulic fluid used is above the permitted operating viscosity, this will result in increased hydraulic-mechanical losses. In return, there will be lower internal leakage losses. If the pressure level is lower, lubrication gaps may not be filled up, which can lead to increased wear. For hydraulic pumps, the permitted suction pressure may not be reached, which may lead to cavitation damage.

If the viscosity of a hydraulic fluid is below the permitted operating viscosity, increased leakage, wear, susceptibility to contamination and a shorter component life cycle will result.

Please ensure that the permissible temperature and viscosity limits are observed for the respective components. This usually requires either cooling or heating, or both.

Fig. 1: Examples V-T diagrams for water-free, fire-resistant hydraulic fluids in comparison to HLP and HFC (reference values, double-logarithmic representation)

Typical viscosity data [mm ² /s]			
at temperature	0 °C	40 °C	100 °C
HFDR	2500	43	5,3
HFDU (ester base)	330	46	9,2
HFDU (glycol base)	350	46	8,7
For comparison HLP (see RE 90220)	610	46	7
For comparison HFC (see RE 90223)	280	46	

Detailed V-T diagrams may be obtained from your lubricant manufacturer for their specific products. Descriptions of the individual classifications can be found in chapter 3.2 and in Table 4.

3.1.2 Viscosity-temperature behavior

For hydraulic fluids, the viscosity temperature behavior (V-T behavior) is of particular importance. Viscosity is characterized in that it drops when the temperature increases and rises when the temperature drops. The interrelation between viscosity and temperature is described by the viscosity index (VI).

For cold testing over a period of several days, the viscosity of ester-based HFDU can increase greatly. After heating, the characteristic values as specified on the data sheet are restored. Please ask your lubricant manufacturer for the "Flow capacity after seven days at low temperature" (ASTM D 2532) for the fluid classification ester-based HFDU .

HFDU fluid based on ester and glycol have better viscosity/temperature characteristics than mineral oil HLP (see Fig. 1).

This should be taken into consideration when selecting hydraulic fluid for the required temperature range. The viscosity and temperature limits required in the product data sheets are to be observed in all operating conditions.

Note

For ambient temperatures below 0 °C, fire-resistant, **water-containing** hydraulic fluids of classification HFC are to be preferred because they observe the component-related viscosity ranges and because they have better pour points (see RE 90223).

3.1.3 Wear protection capability

Wear protection capability describes the property of hydraulic fluids to prevent or minimize wear within the components. The wear protection capability is described in ISO 12922 via test procedures "FZG gear test rig" (ISO 14635-1) and "Mechanical test in the vane pump" (ISO 20763). The wear protection capability of water-free, fire-resistant hydraulic fluids in relation to the two test procedures is comparable to that of mineral oil HLP/HVLP.

3.1.4 Material compatibility

The hydraulic fluid must not negatively affect the materials used in the components. Compatibility with coatings, seals, hoses, metals and plastics is to be observed in particular. The fluid classifications specified in the respective component data sheets are tested by the manufacturer with regard to material compatibility. Parts and components not supplied by us are to be checked by the user.

Table 2: Known material incompatibilities

Classification	Incompatible with:
HFD in general	Seals, plastics and coatings of control cabinets, outer coatings of hydraulic components and accessory components (connectors, wiring harnesses, control cabinets) are to be tested for stability. Note: hydraulic fluid vapors can also lead to incompatibility!
HFDR	Individual component color coating, lead, galvanic zinc-plating, in part non-ferrous metals with zinc, tin and aluminum in a tribological system. Sealing elements made of NBR. In some cases, the latter show major increases in volume when impermissibly aged hydraulic fluids come into contact with the material. Do not use any hydrolysis/susceptible polyurethane qualities.
HFDU based on ester	Single-component color coatings, lead, galvanized zinc coatings, in part non-ferrous metals with zinc, tin, seals made of NBR. In some cases, the latter show major increases in volume when impermissibly aged hydraulic fluids come into contact with the material. Do not use any hydrolysis/susceptible polyurethane qualities.
HFDU based on glycol	Single-component color coatings, steel/aluminum tribocontacts, paper filters, polymethylmethacrylate (PMMA). The compatibility of NBR is to be examined for individual case.

The material incompatibilities mentioned here do not automatically result in function problems. However the elements of the materials are found in the hydraulic fluids after use. The material incompatibilities described here may lead to accelerated aging of the hydraulic fluid and to reduced fire resistance.

3.1.5 Aging resistance

The way a water-free, fire-resistant hydraulic fluid ages depends on the thermal, chemical and mechanical stress to which it is subjected. The influence of water, air, temperature and contamination may be significantly greater than for mineral oils HLP/HVLP. Aging resistance can be greatly influenced by the chemical composition of the hydraulic fluids.

High fluid temperatures (e.g. over 80 °C) result in an approximate halving of the fluid service life for every 10 °C temperature increase and should therefore be avoided. The halving of the fluid service life results from the application of the Arrhenius equation (see Glossary).

Table 3: Reference values for temperature-dependent aging of the hydraulic fluid

Reservoir temperature	Fluid life cycle
80 °C	100 %
90 °C	50 %
100 °C	25 %

A modified aging test (ISO 4263-3 or ASTM D943 – without the addition of water) is specified for fluid classification HFDU. Fluid classification HFDR is described with a special procedure with respect to oxidation stability (EN 14832) and oxidation service life (ISO 4263-3). The calculated fluid service life is derived from the results of tests in which the long-term characteristics are simulated in a short period of time by applying more arduous conditions (condensed testing). This calculated fluid service life is not to be equated to the fluid service life in real-life applications.

Table 3 is a practical indicator for hydraulic fluids with water content < 0.1%, cf. chapter 4.10. "Water".

3.1.6 Environmentally acceptable

HFDU fluids based on ester and glycol are hydraulic fluids which may also be classified as environmentally acceptable. The main criteria for fire-resistant, water-free hydraulic fluids are the leak-free, technically problem-free use and the necessary fire resistance. Environmentally acceptable is merely a supplementary criterion. Notes on environmentally compatible hydraulic fluids can be found in RE 90221.

3.1.7 Air separation ability (ASA)

The air separation ability (ASA) describes the property of a hydraulic fluid to separate undissolved air. Hydraulic fluids always contain dissolved air. During operation, dissolved air may be transformed into undissolved air, leading to cavitation damages. Fluid classification, fluid product, reservoir size and design must be coordinated to take into account the dwell time and ASA value of the hydraulic fluid. The air separation capacity depends on the viscosity, temperature, basic fluid and aging. It cannot be improved by additives.

According to ISO 12922 for instance, an ASA value ≤ 15 minutes is required for viscosity class ISO VG 46, practical values on delivery are < 10 minutes, lower values are preferable.

3.1.8 Demulsifying ability and water solubility

The capacity of a hydraulic fluid to separate water at a defined temperature is known as the demulsifying ability. ISO 6614 defines the demulsifying properties of hydraulic fluids.

The fluid classifications HFDU based on ester and HFDR separate water, but HFD hydraulic fluids have a different water separation ability to mineral oil HLP/HVLP. At 20 °C, in comparison to mineral oil HLP/HVLP, a multiple (> factor 3) of water can separate in the hydraulic fluid. Water solubility is also more temperature-dependent than for mineral oils. The fluid classification HFDU based on glycol usually dissolves water completely, see chapter "4.10 Water".

3.1.9 Filterability

Filterability describes the ability of a hydraulic fluid to pass through a filter, removing solid contaminants. The hydraulic fluids used require a good filterability, not just when new, but also during the whole of their service life. This can differ greatly depending on the different basic fluids (glycols, esters) and additives (VI enhancers, anti-fogging additives).

The filterability is a basic prerequisite for cleanliness, servicing and filtration of hydraulic fluids. Rexroth therefore requires the same degree of filterability of water-free, fire-resistant hydraulic fluids as for mineral oils HLP/HVLP to DIN 51524.

As ISO 12922 does not comment on the filterability of hydraulic fluids, filterability comparable to that of mineral oils HLP/HVLP must be requested of lubricant manufacturers.

Filterability is tested with the new hydraulic fluid and after the addition of 0.2 % water. The underlying standard (ISO 13357-1/-2) stipulates that filterability must have no negative effects on the filters or the hydraulic fluid, see chapter 4 "Hydraulic fluids in operation".

3.1.10 Corrosion protection

Hydraulic fluids should not just prevent corrosion formation on steel components, they must also be compatible with non-ferrous metals and alloys. Corrosion protection tests on different metals and metal alloys are described in ISO 12922.

Rexroth components are usually tested with HLP hydraulic fluids or corrosion protection oils based on mineral oils before they are delivered.

3.1.11 Additivation

The properties described above can be modified with the help of suitable additives.

Bosch Rexroth does not prescribe any specific additive system.

3.2 Classification and fields of application

Table 4: Classification and fields of application

Classification	Features	Typical field of application	Notes
<p>HFDU (glycol-based) according to ISO 12922</p> <p>Density at 15 °C: typically > 0.97 kg/dm³</p> <p>VI: typical > 170</p> <p>The classification "HFDU" is no longer listed in the current standard sheet VDMA 24317.</p>	<p>Base fluid: Glycols</p>	<p>Mobile systems with high thermal loading</p>	<p>For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <ul style="list-style-type: none"> - Very good viscosity/temperature characteristics, shear stability - Resistant to aging - Can be water-soluble - Can be mixed with water - Very good wear protection properties - A higher implementation temperature with the same viscosity in comparison to mineral oil is to be expected - Due to the higher density in comparison to HLP, lower suction pressures are to be anticipated for pumps. Reduce the maximum speed as required and optimize suction conditions. - Prior to commissioning, contact the lubricant manufacturer, as the components are tested with mineral oil HLP/corrosion protection oil. - Incompatible with mineral oil (exceptions must be confirmed by the lubricant manufacturer).
<p>HFDU (ester-based) according to ISO 12922</p> <p>Density at 15 °C: typically 0.90-0.93 kg/dm³</p> <p>VI: typical > 160</p> <p>Iodine count < 90</p> <p>The classification "HFDU" is no longer listed in the current standard sheet VDMA 24317.</p>	<p>Base fluid: Ester based on regenerative raw materials, synthetic ester and mixtures of different esters</p> <p>Because of the fire resistance, HFDU hydraulic fluids based on ester are usually partially saturated esters</p>	<p>Suitable for most fields of application and components.</p>	<p>For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <ul style="list-style-type: none"> - Preferred use of FKM seals. Please enquire about shaft seal rings and implementation temperatures under -15 °C. - Note shear stability (see chapter 4.11 "Fluid servicing, fluid analysis and filtration" and chapter 6 "Glossary") - Fire resistance is not stable over time - In operation, a higher temperature in comparison to mineral oil HLP/HVLP is to be expected given identical design and viscosity. Please check ATEX approvals for hydraulic components. - Limit the lower (see chapter 3.1.2) and upper implementation temperatures (see chapter 3.1.5) - Good viscosity-temperature behavior - Usually classified as insignificantly water-endangering (water hazard class WGK 1) - High dirt dissolving capacity on fluid changeovers - In unfavorable operating conditions (high water content, high temperature), HFDU on ester basis have a tendency to hydrolysis. The acidic organic decomposition products can chemically attack materials and components.

Classification	Features	Typical field of application	Notes
<p>HFDR according to ISO 12922</p> <p>Density at 15 °C: typically 1.1 kg/dm³</p> <p>VI : typical 140–160</p>	Base fluid: phosphoric acid ester	Turbine control systems	<p>For information on approved components, please refer to the respective product data sheet. For components which have not been approved according to the product data sheet, please consult your Bosch Rexroth sales partner.</p> <ul style="list-style-type: none"> – Classified as hazardous materials (for transportation and storage) – Hazardous working material – Water-endangering (Water hazard class 2 – WGK2) – Develops toxic vapors in case of fire – Preferred use of FKM, and possibly PTFE seals. Please enquire for shaft seal rings and implementation temperatures under –15 °C. – In operation, a higher temperature in comparison to mineral oil HLP/HVLP is to be expected given identical design and viscosity – Phosphoric acid esters display a tendency to hydrolysis when they come into contact with moisture. Under the influence of water/moisture, they become unstable or form highly aggressive, acidic components which could damage the hydraulic fluid and component beyond repair. – Poor viscosity/temperature characteristics – Due to the higher density in comparison to HLP, lower suction pressures are to be anticipated for pumps. Reduce the maximum speed as required and optimize suction conditions. – In unfavorable operating conditions (high water content, high temperature), HFDR have a tendency to hydrolysis. The acidic inorganic decomposition products chemically attack materials and components.
HFDU (continued)	Based on triglycerides, mineral oils or related hydrocarbons	Not recommended for Rexroth components!	<p>Hydraulic fluids based on polyalphaolefines are not recommended on account of their poor fire resistance. This classification can usually be identified from: density < 0.89; VI < 140 to 160</p> <p>Hydraulic fluids based on triglycerides are not recommended on account of their aging resistance. This classification can usually be identified from: density > 0.92; VI > 190; iodine count > 90</p> <p>Consult your lubricant manufacturer or your Bosch Rexroth sales partner if the classification of a hydraulic fluid is not clear.</p>
HFDS HFDT	Based on halogenated hydrocarbons or mixtures with halogenated hydrocarbons	Not approved for Rexroth components!	HFDS and HFDT have not been permitted to be manufactured or used since 1989 for environmental reasons.

4 Hydraulic fluids in operation

4.1 General

The properties of hydraulic fluids can change continually during storage and operation.

Please note that the fluid standard ISO 12922 merely describes minimum requirements for hydraulic fluids in new condition at the time of filling into the bins. The operator of a hydraulic system must ensure that the hydraulic fluid remains in a utilizable condition throughout its entire period of use.

Deviations from the characteristic values are to be clarified with the lubricant manufacturer, the test labs or Bosch Rexroth.

Bosch Rexroth will accept no liability for damage to its components within the framework of the applicable liability legislation insofar as the latter is due to non-observance of the following instructions.

Please note the following aspects in operation.

4.2 Storage and handling

Hydraulic fluids must be stored correctly in accordance with the instructions of the lubricant manufacturer. Avoid exposing the containers to lengthy periods of direct heat. Containers are to be stored in such a way that the risk of any foreign liquid or solid matter (e.g. water, foreign fluids or dust) ingress into the inside of the container can be ruled out. After taking hydraulic fluids from the containers, these are immediately to be properly resealed.

Recommendation:

- Store containers in a dry, roofed place
- Store barrels on their sides
- Clean reservoir systems and machine reservoirs regularly

4.3 Filling of new systems

Usually, the cleanliness levels of the hydraulic fluids as delivered do not meet the requirements of our components. Hydraulic fluids must be filtered using an appropriate filter system to minimize solid particle contamination and water in the system.

As early as possible during test operation, new systems should be filled with the selected hydraulic fluid so as to reduce the risk of accidentally mixing fluids (see chapter 4.5 "Mixing and compatibility of different hydraulic fluids"). Changing the hydraulic medium at a later point represents significant additional costs (see following chapter).

4.4 Hydraulic fluid changeover

Problems may be encountered in particular when changing over from water-containing, fire-resistant hydraulic fluid or mineral oils to water-free, fire-resistant hydraulic fluids (e.g. incompatibilities in the form of gelling, silting, stable foam, reduced filterability or filter blockage). This may also happen when changing products within the same classification.

In the case of changeovers of the fluid in hydraulic systems, it is important to ensure compatibility of the new hydraulic fluid with the remains of the previous hydraulic fluid. Bosch Rexroth recommends obtaining verification of compatibility from the

manufacturer or supplier of the new hydraulic fluid. The quantity of old fluid remaining should be minimized. Mixing hydraulic fluids should be avoided, see following chapter.

Information about changing to a hydraulic fluid of a different classification can be found, for example, in VDMA 24314 and in ISO 7745. In addition, the information given in chapter 3.1.4 "Material compatibility" is also to be observed.

Bosch Rexroth will not accept liability for any damage to its components resulting from inadequate hydraulic fluid changeovers!

4.5 Mixing and compatibility of different hydraulic fluids

If hydraulic fluids from different manufacturers or different types from the same manufacturer are mixed, gelling, silting and deposits may occur. These, in turn, may cause foaming, impaired air separation ability, malfunctions and damage to the hydraulic system.

If the fluid contains more than 2 % of another fluid then it is considered to be a mixture. Exceptions apply for water, see chapter 4.10 "Water".

Mixing with other hydraulic fluids is not generally permitted. This includes hydraulic fluids with the same classification. If individual lubricant manufacturers advertise miscibility and/or compatibility, this is entirely the responsibility of the lubricant manufacturer.

Bosch Rexroth customarily tests all components with mineral oil HLP before they are delivered.

Note: With connectible accessory units and mobile filtering systems, there is a considerable risk of non-permitted mixing of the hydraulic fluids!

Rexroth will not accept liability for any damage to its components resulting from mixing hydraulic fluids!

4.6 Re-additivation

Additives added at a later point in time such as colors, wear reducers, VI enhancers or anti-foam additives, may negatively affect the performance properties of the hydraulic fluid and the compatibility with our components and therefore are not permissible.

Rexroth will not accept liability for any damage to its components resulting from re-additivation!

4.7 Foaming behavior

Foam is created by rising air bubbles at the surface of hydraulic fluids in the reservoir. Foam that develops should collapse as quickly as possible.

Common hydraulic fluids in accordance with ISO 12922 are sufficiently inhibited against foam formation in new condition. On account of aging and adsorption onto surfaces, the defoamer concentration may decrease over time, leading to a stable foam.

Defoamers may be re-dosed only after consultation with the lubricant manufacturer and with his written approval.

Defoamers may affect the air separation ability.

4.8 Corrosion

The hydraulic fluid is to guarantee sufficient corrosion protection of components under all operating conditions, even in the event of impermissible water contamination.

Water-free, fire-resistant hydraulic fluids are tested for corrosion protection in the same way as mineral oil HLP/HVLP. When used in practice other corrosion mechanisms are revealed in detail and in individual cases, for the most part in contact with non-ferrous and white alloys.

4.9 Air

Under atmospheric conditions the hydraulic fluid contains dissolved air. In the negative pressure range, for instance in the suction pipe of the pump or downstream of control edges, this dissolved air may transform into undissolved air. The undissolved air content represents a risk of cavitation and of the diesel effect. This results in material erosion of components and increased hydraulic fluid aging.

With the correct measures, such as suction pipe and reservoir design, and an appropriate hydraulic fluid, air intake and separation can be positively influenced.

See also chapter 3.1.7 "Air separation ability (ASA)".

4.10 Water

Water contamination in hydraulic fluids can result from direct ingress or indirectly through condensation of water from the air due to temperature variations.

HFDU hydraulic fluids on glycol basis are water-soluble or can be mixed with water. This means that any water that has ingressed into the system cannot be drained off in the sump of the reservoir.

In the case of HDFU hydraulic fluids on ester basis, undissolved water can be drained off from the reservoir sump, the remaining water content is however too high to ensure that the maximum permissible water limit values are observed in the long term.

With the fluid classification HFDR, the greater density of the ester means that the any water that has ingressed will be on the surface of the hydraulic fluid. This means that any water that has ingressed into the system cannot be drained off in the sump of the reservoir.

Water in the hydraulic fluid can result in wear or direct failure of hydraulic components. Furthermore, a high water content in the hydraulic fluid negatively affects aging and filterability and increases susceptibility to cavitation. During operation, the water content in all hydraulic fluids, determined according to the "Karl Fischer method" (see chapter 6 "Glossary") for all water-free, fire-resistant hydraulic fluids must constantly be kept below 0.1% (1000 ppm). To ensure a long service life of both hydraulic fluids and components, Bosch Rexroth recommends that values below 0.05% (500 ppm) are permanently maintained.

Due to the higher water solubility in comparison to mineral oil HLP/HVLP it is urgently advised that precautions be taken when using water-free, fire-resistant hydraulic fluids, such as a dehumidifier on the reservoir ventilation.

Water content has an affect particularly in the case of HEDU hydraulic fluid on ester basis and HFDR in that it accelerates aging (hydrolysis) of the hydraulic fluid and biological degradation, see chapter 4.11 "Fluid servicing, fluid analysis and filtration".

4.11 Fluid servicing, fluid analysis and filtration

Air, water, operating temperature influences and solid matter contamination will change the performance characteristics of hydraulic fluids and cause them to age.

To preserve the usage properties and ensure a long service life for hydraulic fluid and components, the monitoring of the fluid condition and a filtration adapted to the application requirements (draining and degassing if required) are indispensable.

The effort is higher in the case of unfavorable usage conditions, increased stress for the hydraulic system or high expectations as to availability and service life, see chapter 2 "Solid particle contamination and cleanliness levels".

When commissioning a system, please note that the required minimum cleanliness level can frequently be attained only by flushing the system. Due to severe start-up contamination, it may be possible that a fluid and/or filter replacement becomes necessary after a short operating period (< 50 operating hours).

The hydraulic fluid must be replaced at regular intervals and tested by the lubricant manufacturer or recognized accredited test labs. **We recommend a reference analysis after commissioning.**

The minimum data to be tested for analyses are:

- Viscosity at 40 °C and 100 °C
- Neutralization number NN (acid number AN)
- Water content (Karl-Fischer method)
- Particle measurement with evaluation according to ISO 4406 or mass of solid foreign substances with evaluation to EN 12662
- Element analysis (RFA (EDX) / ICP, specify test method)
- Comparison with new product or available trend analyses
- Assessment / evaluation for further use
- Also recommended: IR spectrum

No differences are needed in the maintenance and care of water-free, fire-resistant hydraulic fluids with the appropriate suitability parameters compared to HLP/HVLP mineral oils. Attention is however drawn to the note in chapter 1.3.

After changing over hydraulic fluids it is recommended that the filters be replaced again after 50 operating hours as fluid aging products may have detached themselves ("self-cleaning effect").

Compared to the pure unused hydraulic fluid the changed neutralization number NN (acid number AN) indicates how many aging products are contained in the hydraulic fluid. This difference must be kept as small as possible. The lubricant manufacturer should be contacted as soon as the trend analysis notes a significant increase in values.

A higher viscosity than that of new materials indicates that the hydraulic fluid has aged. Evaluation by the test lab or lubricant manufacturers is however authoritative, whose recommendation should be urgently observed.

On systems where the possibility of water contamination cannot be completely ruled out (also condensation), it should be ensured via the hydraulic system circuit that fluid aging products are not accumulating in individual areas of the hydraulic system, but are being removed from the system in a controlled manner via the filtration system. This should be ensured via suitable hydraulic circuits (e.g. flushing circuit) or system manufacturer's operating instructions/specifications.

In case of warranty, liability or guarantee claims to Bosch Rexroth, service verification and/or the results of fluid analyses are to be provided.

5 Disposal and environmental protection

All water-free, fire-resistant hydraulic fluids, are, like mineral oil-based hydraulic fluids, subject to special disposal obligations.

The respective lubricant manufacturers provide specifications on environmentally acceptable handling and storage. Please ensure that spilt or splashed fluids are absorbed with appropriate adsorbents or by a technique that prevents it contaminating water courses, the ground or sewerage systems.

It is also not permitted to mix fluids when disposing of hydraulic fluids. Regulations governing the handling of used oils stipulate that used oils are not to mixed with other products, e.g. substances containing halogen. Non-compliance will increase disposal costs. Comply with the national legal provisions concerning the disposal of the corresponding hydraulic fluid. Comply with the local safety data sheet of the lubricant manufacturer for the country concerned.

6 Glossary

Additivation

Additives are chemical substances added to the basic fluids to achieve or improve specific properties.

Aging

Hydraulic fluids age due to oxidation (see chapter 3.1.5 "Aging resistance"). Liquid and solid contamination acts as a catalyzer for aging, meaning that it needs to be minimized as far as possible by careful filtration. Please refer to Hydrolysis.

Arrhenius equation

The quantitative relation between reaction rate and temperature is described by an exponential function, the Arrhenius equation. This function is usually visualized within the typical temperature range of the hydraulic system. For a practical example, see chapter 3.1.5 "Aging resistance".

Basic fluids

In general, a hydraulic fluid is made up of a basic fluid, or base oil, and chemical substances, the so-called additives. The proportion of basic fluid is generally greater than 90%.

Diesel effect

If hydraulic fluid that contains air bubbles is compressed quickly, the bubbles are heated to such a degree that a self-ignition of the air-gas mix may occur. The resultant temperature increase may lead to seal damage and increased aging of the hydraulic fluid.

Partially saturated esters

In contrast to saturated esters, partially saturated esters have double/multiple bonds between C atoms. Rexroth defines partially saturated esters as unsaturated bonds and mixtures of esters with unsaturated and saturated bonds. Esters with unsaturated bonds are produced on the basis of renewable raw materials.

Depending on their number and position, these unsaturated bonds between the C atoms are instable. These bonds can detach themselves and form new bonds, thus changing the properties of those liquids (an aging mechanism). Attention is however drawn to the note in chapter 1.3.

Hydrolysis

Hydrolysis is the splitting of a chemical bond through the reaction with water under the influence of temperature.

ICP (atomic emission spectroscopy)

The ICP procedure can be used to determine various wear metals, contamination types and additives. Practically all elements in the periodic system can be detected with this method.

Iodine count

The iodine count is a yardstick for the quantity of single and multiple unsaturated bonds between C atoms in the basic fluid. A low iodine count indicates that the hydraulic fluid contains few unsaturated bonds and is thus considerably more resistant to aging than a hydraulic fluid with a high iodine count. A statement about the position at which these multiple bonds are located and about how "stable" they are against influencing factors cannot be derived simply by stating the iodine count.

Karl Fischer method

Method to determine the water content in fluids. Indirect coulometric determination procedure in accordance with DIN EN ISO 12937 in connection with DIN 51777-2. Only the combination of both standards will assure adequately accurate measured values. For hydraulic fluids based on glycol, DIN EN ISO 12937 is to be applied in conjunction with DIN 51777-1.

Cavitation

Cavitation is the creation of cavities in fluids due to pressure reduction below the saturated vapour pressure and subsequent implosion when the pressure increases. When the cavities implode, extremely high acceleration, temperatures and pressure may occur temporarily, which may damage the component surfaces.

Neutralization number (NN)

The neutralization number (NN) or acid number (AN) specifies the amount of caustic potash required to neutralize the acid contained in one gram of fluid.

Pour point

The lowest temperature at which the fluid still just flows when cooled down under set conditions. The pour point is specified in the lubricant manufacturers' technical data sheets as a reference value for achieving this flow limit.

RFA (wavelength dispersive x-ray fluorescence analysis)

Is a procedure to determine nearly all elements in liquid and solid samples with nearly any composition. This analysis method is suitable for examining additives and contamination, delivering fast results.

Shearing/shear loss

Shearing of molecule chains during operation can change the viscosity of hydraulic fluids with long chain VI enhancers and anti-fogging additives. The initially high viscosity index drops. This needs to be taken into account when selecting the hydraulic fluid.

The only value at present that can be used to assess viscosity changes in operation is the result of the test in accordance with DIN 51350 part -6. Please note that there are practical applications that create a much higher shear load on such hydraulic fluids than can be achieved by this test.

Viscosity

Viscosity is the measure of the internal friction of a fluid to flow. It is defined as the property of a substance to flow under tension. Viscosity is the most important characteristic for describing the load-bearing capacity of a hydraulic fluid.

Kinematic viscosity is the ratio of the dynamic viscosity and the density of the fluid; the unit is mm²/s. Hydraulic fluids are classified by their kinematic viscosity into ISO viscosity classes. The reference temperature for this is 40 °C.

Viscosity index (VI)

Refers to the viscosity temperature behavior of a fluid. The lower the change of viscosity in relation the temperature, the higher the VI.

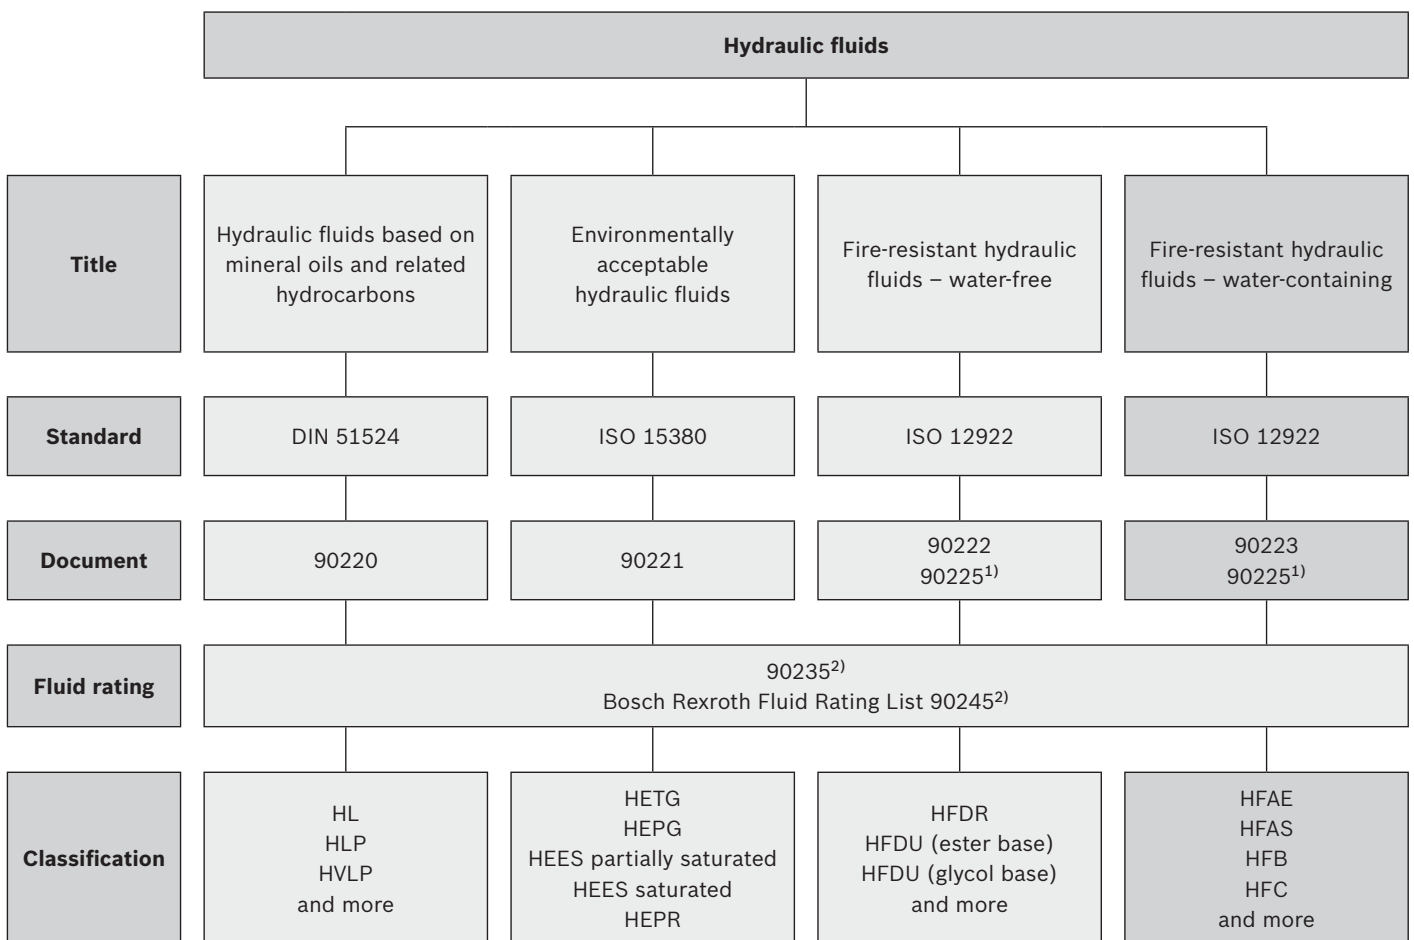

Fire-resistant hydraulic fluids – water-containing (HFAE, HFAS, HFB, HFC)

1 Basic information

1.1 General instructions

Hydraulic fluid is the common element in any hydraulic system and must be selected very carefully. Quality and cleanliness of the hydraulic fluid are decisive factors for the operational reliability, efficiency, and life cycle of the system. Hydraulic fluids must conform, be selected and used in accordance with the generally acknowledged rules of technology and safety provisions. Reference is made to the country-specific standards and directives (in Germany the directive of the Employer's Liability Insurance Association BGR 137).

This document includes recommendations and regulations concerning the selection, operation, and disposal of water-containing, fire-resistant hydraulic fluids in the application of Rexroth hydraulic components.

The individual selection of hydraulic fluid or the choice of classification are the responsibility of the operator.

It is also the responsibility of the operator to ensure that appropriate measures are taken for safety and health protection and to ensure compliance with statutory regulations. The recommendations of the lubricant manufacturer and the specifications given in the safety data sheet are to be observed when using hydraulic fluid.

This document does not release the operator from verifying the conformity and suitability of the respective hydraulic fluid for his system. The operator of a hydraulic system must ensure that the hydraulic fluid remains fit for purpose throughout its entire period of use.

The currently valid standard for fire-resistant hydraulic fluids is ISO 12922. In addition, even more detailed documents, guidelines, specifications, and laws (the observance of which the operator shall also be responsible) may be valid. This includes, for instance:

- a. 90235 - Assessment of hydraulic fluids used in Rexroth hydraulic components (pumps and motors)
- b. 7th Luxembourg Report: Luxembourg, April 1994 - Doc. No. 4746/10/91 EN "Requirements and tests applicable to fire-resistant hydraulic fluids used for power transmission and control (hydrostatic and hydrokinetic)"
- c. VDMA 24314 (1981-11): "Change of pressure liquids – Directives"
- d. VDMA 24317 (2005-11): "Fire-resistant hydraulic fluids - Minimum technical requirements"

- e. FM Approval Standard 6930 (2009-04): "Flammability Classification of Industrial Fluids" (only available in English)
- f. DIN Technical Report CEN/TR 14489 (2006-01): "Selection guidelines for protecting safety, health, and the environment"
- g. BGR 137 - Handling hydraulic fluids (1997-04): German trade association rules health and safety at work.
- h. DIN 24320: "Fire-resistant fluids - Hydraulic fluids of categories HFAE and HFAS - Characteristics and requirements"
- i. List of hydraulic fluids in the set of regulations for the mining sector (coal mining): http://www.bezregarnsberg.nrw.de/themen/s/schwerentflammbare_hydraulikfluessigkeiten/index.php
- j. RAG N 762010 (2012-10): "Fire-resistant hydraulic fluids HFC-E, requirements"
- k. RAG N 762011 (2012-09): "Requirements on synthetic, fire-resistant hydraulic fluids (HFA-S and synthetic emulsions)"
- l. Ordinance for all mining sectors - ABergV (1995-10): General Federal Mining Ordinance
- m. Occupational Health and Safety Ordinance for Mines (GesBergV) (1991-07): Mining ordinance for the health protection of mineworkers

We recommend that you maintain constant, close contact with lubricant manufacturers to support you in the selection, maintenance, care, and analyses.

When disposing of used hydraulic fluids, apply the same care as during use.

1.2 Fire resistance

There is no clear legal definition of fire-resistant hydraulic fluids. There are great differences regarding fire resistance. Selection is the sole responsibility of the system operator with respect to requirements (application, construction and design of the system, hottest ignition source in the system, required fire protection).

The most important task in determining the fire resistance of hydraulic fluids is to find a test method that reproduces the situation occurring in a specific application. Different test methods are used to assess the fire resistance according to ISO 12922:

- ▶ Spray ignition characteristics according to ISO 15029-1 (Spray flame persistence – Hollow-cone nozzle method)
- ▶ Spray ignition characteristics according to ISO 15029-2 (Stabilized flame heat release method) Flammability index (RI)
- ▶ Wick flame persistence of fluids according to ISO 14935 (average flame persistence)
- ▶ Flammability on hot surfaces according to ISO 20823 (ignition temperature, spread of flame)

The required minimum values for the ignition temperature differ according to ISO 12922:

HFB: 650 °C, HFC: 600 °C, HFDU: 400 °C, HFDR: 700 °C

In general, fire-resistant hydraulic fluids are distinguished between fire-resistant, **water-free**, and fire-resistant, **water-containing** hydraulic fluids. The fire-resistant, water-free hydraulic fluids are described in Document 90222.

Fire resistant, water-containing hydraulic fluids are normally understood as hydraulic fluids with a proportion greater than 35% by mass of water (according to ISO 12922).

Information

- ▶ Only fire-resistant, water-containing hydraulic fluids can currently receive approval from the mining authorities for use in coal mining below ground.
- ▶ In contrast to water-free fluids, all fire-resistant, water-containing hydraulic fluids do not have a flash point or combustion point.
- ▶ The test conditions for determining the flammability on hot surfaces vary significantly within ISO 12922 between fire-resistant, water-free and fire-resistant, water-containing hydraulic fluids (e.g. different testing temperatures).
- ▶ Just as much care should be taken when working with fire-resistant hydraulic fluids as with other hydraulic fluids, e.g. mineral oils. Leakage in the hydraulic system must be prevented. The best and most cost-effective protection against fire and explosion is to prevent leakage with meticulous servicing, and maintenance and care of the hydraulic system.
- ▶ If possible, the system should be designed such that fires and explosions cannot arise.

1.3 Scope

This document must be applied when using fire-resistant, water-containing hydraulic fluids in Bosch Rexroth hydraulic components. Please note that the specifications in this document may be further defined by the data sheets for the individual components.

The use of the individual fire-resistant, water-containing hydraulic fluids according to the intended purpose can be found in the safety data sheets or other product description documents of the lubricant manufacturers.

Rexroth hydraulic components may only be operated with fire-resistant, water-containing hydraulic fluids according to ISO 12922 if this is specified in the respective component data sheet or if a Rexroth approval for use is furnished.

The manufacturers of hydraulic systems must adjust their systems and operating instructions to the fire-resistant, water-containing hydraulic fluids.

Bosch Rexroth will accept no liability for its components for any damage resulting from failure to comply with the notes below.

1.4 Safety instructions

Hydraulic fluids can constitute a risk for persons and the environment. These risks are described in the hydraulic fluid safety data sheets. The operator is to ensure that a current safety data sheet for the hydraulic fluid used is available and that the measures stipulated therein are complied with.

See also sub-paragraphs 1.1 b., f., g., j., k., and l.

2 Solid particle contamination and cleanliness levels

Solid particle contamination is the major reason for faults occurring in hydraulic systems. It may lead to a number of effects in the hydraulic system. Firstly, single large solid particles may lead directly to a system malfunction, and secondly small particles cause continuous elevated wear. For fire-resistant, water-containing hydraulic fluids, the cleanliness level is given as a three-digit numerical code in accordance with ISO 4406. The determination of this is made pursuant to the microscope method according to ISO 4407. The automatic method cannot be applied for fire-resistant, water-containing hydraulic fluids, since oil droplets could be counted as particles, for instance. This numerical code denotes the number of particles present in a hydraulic fluid for a defined quantity. Only particles $> 5 \mu\text{m}$ and $> 15 \mu\text{m}$ are counted here. The specification of the cleanliness level according to ISO 4406 thus only relates to those two particle sizes; for example: "ISO 4406: - / 18 / 15". The type of measuring method applied must always be specified as well when the cleanliness level is being determined. ISO 4406 is generally preferred in hydraulics. Moreover, foreign solid matter is not to exceed a mass of 50 mg/kg (gravimetric examination according to ISO 4405).

In general, compliance with a minimum cleanliness level of 20/18/15 according to ISO 4406 or better is to be maintained during operation. Special servo valves require better cleanliness levels of at least 18/16/13. An ordinal number lower by one signifies one half of the number of particles, and thus a higher level of cleanliness. Lower numbers in cleanliness levels should always be striven for, and extend the service life of hydraulic components. The component with the highest cleanliness requirements determines the required cleanliness for the overall system. Please also note the information given in Table 1: "Cleanliness levels according to ISO 4406" and in the respective data sheets for the various hydraulic components.

As an option, SAE AS 4059 can be used instead of ISO 4406 if particles above the size of $14 \mu\text{m}$ are going to be identified. The specification of cleanliness levels using cumulative particle counts is indicated by way of a letter/numerical code, although usually the particle size with the highest code is specified.

Hydraulic fluids frequently fail to meet the cleanliness requirements on delivery (basic contamination in containers). Careful filtering is therefore required during operation and, in particular, during filling in order to ensure the required cleanliness levels in the system. Your lubricant manufacturer can tell you the cleanliness levels of hydraulic fluids as delivered. To maintain the required cleanliness level over the operating period, it is recommended that a tank breather filter be used.

Information

Note: the specifications of the lubricant manufacturer relating to cleanliness levels are based on the time at which the container concerned is filled and not on the conditions during transport and storage.

Further information about solid matter contamination and cleanliness levels can be found in the Bosch Rexroth oil cleanliness booklet R999000239.

Filter inspections and tests can be ordered at Bosch Rexroth as a service using the number R928037504 - Filter inspection - (inspection of used filter cartridges).

Table 1: Cleanliness levels according to ISO 4406 (determination according to ISO 4407)

Particles per 100 ml		Ordinal number
More than	Up to and including	
8,000,000	16,000,000	24
4,000,000	8,000,000	23
2,000,000	4,000,000	22
1,000,000	2,000,000	21
500,000	1,000,000	20
250,000	500,000	19
130,000	250,000	18
64000	130,000	17
32000	64000	16
16000	32000	15
8000	16000	14
4000	8000	13
2000	4000	12
1000	2000	11
500	1000	10
250	500	9
130	250	8
64	130	7
32	64	6

3 Selection of the hydraulic fluid

Fire-resistant, water-containing hydraulic fluids for Bosch Rexroth hydraulic components are assessed on the basis of their fulfillment of the minimum requirements according to ISO 12922.

Based on this, hydraulic fluids can be used that were assessed by Bosch Rexroth according to 90235 (fluid rating).

3.1 Selection criteria for the hydraulic fluid

The specified limit values for all components employed in the hydraulic system, for example required viscosities and cleanliness levels, need to be complied with while observing the specified operating conditions with the hydraulic fluid used. Please refer to the data sheet for the respective Rexroth hydraulic component for the permissible viscosity range, the required cleanliness levels, and the approved operating data.

Hydraulic fluid suitability depends, among other things, on the following factors:

3.1.1 Viscosity

Viscosity is a basic property of hydraulic fluids. The permissible viscosity range of complete systems needs to be determined taking account of the permissible viscosity of all components, and it is to be observed for each individual component.

The viscosity at operating temperature determines the response characteristics of closed control loops, stability and damping of systems, the efficiency factor, and the degree of wear.

We recommend that the optimum operating viscosity range of each component be kept within the permissible temperature range.

If the viscosity of a hydraulic fluid used is above the permitted operating viscosity, this will result in increased hydraulic-mechanical losses. However, internal leakage losses will be fewer. If the pressure level is lower, lubrication gaps may not be filled up, which can lead to increased wear. For hydraulic pumps, the permitted suction pressure may not be reached, which could lead to cavitation damage.

If the viscosity of a hydraulic fluid is below the permitted operating viscosity, increased leakage, wear, susceptibility to contamination, and a shorter life cycle in the components will result.

Please ensure that the permissible temperature and viscosity limits are observed for the respective components. This usually requires either cooling or heating, or both.

The viscosity is influenced by the water content. If water loss occurs during operation owing to temperatures > +40 °C, then the viscosity will increase firstly (mainly in

open systems). If the viscosity drops when the water content is reduced or if it remains the same, then the polymers in the water-glycol mixture are either damaged or sheared.

Fig. 1: Example ν - T -diagram HFA, HFAS concentrated, HFC compared to HFDR, HFDU (ester based) and HLP (reference values, double-logarithmic presentation)

Table 2: Examples of typical viscosity data [mm²/s] in different hydraulic fluids

Temperature	-20 °C	0 °C	40 °C	60 °C	100 °C
HFA	- ¹⁾	1.75	0.65	0.47	- ²⁾
HFAS concentrated	- ¹⁾	550	42	18.7	- ²⁾
HFC	1183	295	46	24.3	- ²⁾
compare HFDR (see 90222)	(14250) ³⁾	956	43	17.1	(5) ³⁾
compare HFDU (ester based) (see 90222)	1195	310	50	26.5	10.4
compare HLP (see 90220)	(4034) ³⁾	547	46	20.8	(6.9) ³⁾

- 1) Not applicable (see Pour point)
- 2) Not applicable (water loss in depressurized reservoir)
- 3) Observe permissible viscosity range for the respective hydraulic component.

3.1.2 Viscosity temperature behavior

In hydraulic fluids, it is primarily the viscosity temperature behavior (ν - T -behavior) that is of particular importance. In hydraulic fluids, the viscosity is characterized in that it drops when the temperature increases and rises when the temperature drops. The interrelation between viscosity and temperature is described by the viscosity index (VI). HFC hydraulic fluids have a better viscosity temperature behavior than HLP mineral oil. In HFA hydraulic fluids, the dependency of the viscosity on the temperature is negligible.

The differing viscosity temperature behavior needs to be taken into consideration when selecting hydraulic fluid for the required temperature range. Owing to a high vapor pressure in comparison to a similar HLP mineral oil, the maximum operating temperature when working with fire-resistant, water-containing hydraulic fluids must be limited. Reservoir temperatures above +50 °C must be prevented in open systems, because they can lead to serious water loss and accelerate the aging process in the hydraulic fluid. Furthermore, in HFC hydraulic fluids, water losses that are too high can lead to both an increase in viscosity and to a reduction in the fire-resistant properties.

Information

- ▶ The minimum operating temperature for HFA hydraulic fluids is +5 °C.
- ▶ HFC hydraulic fluids respond very well at low temperatures and have a lower pour point when compared to HLP mineral oils.

3.1.3 Wear protection capability

Wear protection capability describes the property of hydraulic fluids to prevent or minimize wear within the components.

This is described in ISO 12922 for HFC hydraulic fluids using the following test methods:

- ▶ Mechanical testing in the vane pump (ISO 20763), method B (reduced temperature and working pressure when compared to HLP mineral oil)
- ▶ Testing in the four-ball apparatus (ISO 20623)
- ▶ Testing in the FZG test machine for mechanical stress in the gears (ISO 14635-1), reduced test temperature when compared with HLP mineral oil: in accordance with the 7th Luxembourg Report or ISO 12922 for HFB and HFC at 60 °C.

These test methods cannot be applied for HFA hydraulic fluids.

The test methods and test conditions for fire-resistant, water-containing hydraulic fluids are not comparable to those used for HLP/HVLP mineral oils. This is why the operating data for Rexroth hydraulic components that were optimized for HLP/HVLP mineral oils are (in part) limited. To some extent, Rexroth hydraulic components specifically developed for fire-resistant, water-containing hydraulic fluids are available without the limitation of operating data (e.g. in 92053, the A4VSO axial piston variable pump for HFC hydraulic fluids).

3.1.4 Material compatibility

The hydraulic fluid must not negatively affect the materials used in the components. Compatibility with coatings, seals, hoses, metals, and plastics is to be observed in particular. The fluid classifications specified in the respective components data sheets are tested by the manufacturer with regard to material compatibility. Parts and components not supplied by us are to be checked by the user.

The material incompatibilities mentioned here do not automatically result in function problems. However the elements of the materials are found in the hydraulic fluid after use. Material incompatibilities may, where applicable, lead to an accelerated aging process in the hydraulic fluid and to increased wear and corrosion of the components.

Table 3: Known incompatibilities of materials

Classification	Incompatible with
Water-containing HF... general	<p>Seals/plastics/coatings FKM elastomers are normally not resistant, NBR elastomers are recommended. Seals, plastics, coatings (of control cabinets, too), outer coatings of hydraulic components, and accessory components (connectors, wiring harnesses, control cabinets) are to be tested for stability. Note: hydraulic fluid vapors can also lead to incompatibility!</p> <p>Coatings on the inside of the reservoir Single component lacquer (e.g. zinc dust paint) is unstable; the use of stainless steel reservoirs (rustproof steel) is recommended.</p> <p>Zinc Zinc and zinc coatings exhibit in the static immersion test only a minimal amount of change in weight. If zinc (e.g. Zn die-cast housings for filters etc.) is attacked even to a minimal extent, then voluminous reaction products are formed (e.g. zinc soaps) that may block the filters, solenoids etc.</p> <p>Aluminum Aluminum alloys are not stable in all cases (risk of corrosion with cast aluminum). Above all, it is the simpler properties that get attacked, especially if they come into contact with steel parts. The electrochemical reaction with steel (potential difference approx. 1.23 V) may cause a severe case of aluminum removal. Anodized aluminum is suitable for static loading. Aluminum wrought alloys offer improved stability.</p> <p>Cadmium/magnesium Cadmium and magnesium alloys are not compatible.</p> <p>Lead Pure lead is noticeably attacked already in the static compatibility test.</p>
HFB	<p>Seals Polyurethane (AU) not stable</p>
HFC	<p>Seals Polyurethane (AU) not stable</p> <p>Tin and zinc Tin and zinc should be avoided in systems using HFC hydraulic fluids. Residual amounts of HLP mineral oils containing zinc and oils used for corrosion protection must be avoided.</p>

3.1.5 Aging resistance

Fire-resistant, water-containing hydraulic fluids are less subject to thermal load than HLP mineral oils, which is why they are substantially less subject to aging.

In HFAE hydraulic fluids, microbial contamination can cause undesirable aging in the hydraulic fluid. Fungal slime, cakes of fungus, and yeasts can clog filters and lines.

3.1.6 Environmental compatibility

Fire-resistant, water-containing hydraulic fluids are hydraulic fluids that can also be environmentally acceptable at the same time. The main criterion for fire-resistant, water-containing hydraulic fluids is the leak-free, technically problem-free application with the necessary fire resistance. Environmental compatibility is merely a supplementary criterion. You can recognize the environmental compatibility in the technical data sheet for the hydraulic fluid using the reference to:

- ▶ DIN Technical Report CEN/TR 14489
- ▶ BGR 137
- ▶ 7th Luxembourg Report, Part IV “assessment of health hazards” and Part VI “assessment of environmental compatibility”
- ▶ Occupational Health and Safety Ordinance for Mines (GesBergV)

Please refer to the safety data sheet of the respective hydraulic fluids for more information on environmental compatibility.

Information on other environmentally acceptable hydraulic fluids can be found (without reference to fire resistance) in Document 90221.

3.1.7 Air separation ability (ASA)

The air separation ability (ASA) describes the property of a hydraulic fluid to separate undissolved air. Hydraulic fluids always contain dissolved air. During operation, dissolved air may be transformed into undissolved air, leading to cavitation damage.

Furthermore, the system behavior can differ due to the higher proportion of undissolved air when compared with HLP mineral oil. According to ISO 12922, a specific value for the air separation ability is not required for the HFAE and HFAS classifications.

The air separation ability for the HFC classification depends

on the viscosity, the temperature, basic fluid, and aging. It cannot be improved by additives.

Fluid classification, fluid product, reservoir size and design must be coordinated to take into account the dwell time and ASA value of the hydraulic fluid.

According to ISO 12922 for instance, an ASA value of ≤ 25 minutes is required for HFC in viscosity class ISO VG 46, lower values are preferable.

3.2 Classification and fields of application

Table 4: Classification and fields of application

Classification	Features	Typical field of application	Information
HFAE according to ISO 12922	Oil-in-water emulsions	Mine support, hydrostatic drives, hydraulic strut extension below ground	Approved for all components that allow "HFAE according to ISO 12922" in the product data sheet for hydraulic fluids. Observe limitations in the operating data for the respective components.
Density at 15 °C typically 1.00 kg/dm ³	Viscosity at 40 °C: max. 5 mm ² /s		- Water-polluting (WGK 1 to 3) - Reservoir temperature +5 °C to +50 °C - Resistance to aging, see chapter 3.1.5 - Owing to the higher density by comparison to HLP, lower intake pressures are to be expected in pumps and, where applicable, the flow must be reduced and the intake conditions optimized (higher cavitation tendency)
Normal water content ≥ 95% (m/m)	Appearance: milky to translucent emulsion		
HFAS according to ISO 12922	Chemical solutions in water	Mine support, foundry technology, press hydraulics (example: hydroforming)	Approved for all components that allow "HFAS according to ISO 12922" in the product data sheet for hydraulic fluids. Observe limitations in the operating data for the respective components.
Density at 15 °C typically 1.00 kg/dm ³	Viscosity at 40 °C: max. 5 mm ² /s or thickened variants up to ISO VG 68		- Mineral-oil free - Water-polluting (WGK 1 to 2) - Reservoir temperature +5 °C to +50 °C - Owing to the higher density by comparison to HLP, lower intake pressures are to be expected in pumps and, where applicable, the flow must be reduced and the intake conditions optimized (higher cavitation tendency)
Normal water content ≥ 95% (m/m)	Appearance: transparent		
HFB according to ISO 12922	Water-in-oil emulsions	Mostly in coal mining below ground, primarily in the U.K. (hydrostatic control systems and drives)	Practical requirements are frequently not fulfilled by hydraulic fluids in this classification. As a result of a high mineral oil content up to 60%, they do not meet the limit values for spray ignition characteristics (fire resistance) prescribed in Germany. Observe limitations in the operating data for the respective components.
Density at 15 °C typically 0.92 to 1.05 kg/dm ³	Viscosity classes: ISO VG 46 up to 100		- Water-polluting (WGK 1 to 3) - Reservoir temperature +5 °C to +50 °C - Owing to the higher density by comparison to HLP mineral oil, lower intake pressures are to be expected in pumps and, where applicable, the flow must be reduced and the intake conditions optimized (higher cavitation tendency)
Normal water content ≥ 40% (m/m)			
HFC according to ISO 12922	Watery polymer solutions	All application areas where water-free hydraulic fluids are not permitted due to the risk of fire. For example: The steel industry, coking plants, foundries, hardening plants, forming presses, injection molding and pressure die casting machines, mining technology (exception: salt mining)	Approved for all components that allow "HFC according to ISO 12922" in the product data sheet for hydraulic fluids. Observe limitations in the operating data for the respective components.
Density at 15 °C typically 1.07 to 1.09 kg/dm ³	Viscosity classes: ISO VG 22 up to 68 Usually ISO VG 46		- Categorized as non-/minimally water-polluting (NWG/WGK 1) - Reservoir temperatures -20 °C to +50 °C - Very good viscosity temperature behavior - Owing to the higher density by comparison to HLP mineral oil, lower intake pressures are to be expected in pumps and, where applicable, the flow must be reduced and the intake conditions optimized (higher cavitation tendency).
VI: typically > 150			- A reservoir with an inspection port above the fill level is recommended in order to remove floating residual oil.
Normal water content ≥ 35% (m/m)			
HFC-E not standardized according to ISO 12922	Watery polymer solutions	Mostly in coal mining below ground, primarily in Germany	- Like HFC, but improved protection against wear and extended temperature range up to 70 °C
Density at 15 °C typically 1.07 to 1.14 kg/dm ³	Viscosity classes: ISO VG 46 up to 68 Normally ISO VG 68		
VI: typically > 135			
Normal water content 18 to 20% (m/m)			

4 Hydraulic fluids in operation

4.1 General

The properties of hydraulic fluids can change continually during storage and operation.

Please note that the fluid standard ISO 12922 merely describes minimum requirements for hydraulic fluids in new condition at the time of filling into the delivery containers. The operator of a hydraulic system must ensure that the hydraulic fluid remains fit for purpose throughout its entire period of use.

Deviations from the characteristic values are to be clarified with the lubricant manufacturer, the test labs, or Bosch Rexroth.

Bosch Rexroth will accept no liability for damage to its components within the framework of the applicable liability legislation insofar as the latter is due to non-observance of the following instructions.

Please note the following aspects in operation.

4.2 Storage and handling

Hydraulic fluids must be stored correctly in accordance with the instructions of the lubricant manufacturer. Avoid exposing the containers to lengthy periods of direct heat. A container is to be stored such that the risk of any foreign liquid or solid matter (e.g. water, foreign fluids, or dust) ingress into the inside of the container can be ruled out. After taking hydraulic fluids from the containers, these are to be properly resealed immediately. HFAE and HFAS hydraulic fluids are delivered in a concentrated form. Please observe the hardness (°dH) in order to produce the finished product, lower hardness values should be aimed at (°dH, calcium oxide CaO in ppm).

Recommendation:

- ▶ Store containers in a dry, roofed place
- ▶ Store HFA containers frost-protected
- ▶ Clean reservoir systems and machine reservoirs regularly

Please refer to the respective safety data sheet for the minimum storage duration and storage conditions.

4.3 Filling of new systems

Usually, the cleanliness levels of the hydraulic fluids as delivered do not meet the requirements of our hydraulic components at the company. When filling, hydraulic fluids must be filtered using an appropriate filter system to minimize solid particle contamination in the system.

As early as possible during test operation, new systems should be filled with the selected hydraulic fluid so as to reduce the risk of accidentally mixing the fluids (see chapter 4.5 “Mixing and compatibility of different hydraulic fluids”). Changing the hydraulic medium at a later point represents significant additional costs (see following section).

4.4 Hydraulic fluid changeover

Problems may be encountered in particular when changing over from fire-resistant, water-free hydraulic fluids or mineral oils to fire-resistant, water-containing hydraulic fluids (e.g. incompatibilities in the form of gelling, silting, stable foam, reduced filterability, or filter blockage). This may also happen when changing products within the same classification.

In the case of changeovers of the fluid in hydraulic systems, it is important to ensure compatibility and miscibility of the new hydraulic fluid with the remains of the previous hydraulic fluid from the system.

Bosch Rexroth recommends obtaining verification of compatibility and miscibility from the manufacturer or supplier of the new hydraulic fluid. The remainder quantities of the old fluid need to be minimized. Mixing hydraulic fluids should be avoided; see following section.

Information on changing over hydraulic fluids with different classifications can be found in VDMA 24314 and ISO 7745, among others. Beyond that, please observe chapter 3.1.4 “Material compatibility”.

Bosch Rexroth will not accept liability for any damage to its components resulting from inadequate hydraulic fluid changeovers!

4.5 Mixing and compatibility of different hydraulic fluids

If hydraulic fluids from different manufacturers or different types from the same manufacturer are mixed, gelling, silt-ing, and deposits may occur. These, in turn, may cause foaming, impaired air separation ability, malfunctions, and damage to the hydraulic system.

If the fluid contains more than 2% of another fluid then it is considered to be a mixture.

Mixing with other hydraulic fluids is not generally permitted. This includes hydraulic fluids with the same classification. If individual lubricant manufacturers advertise miscibility and/or compatibility, this is entirely the responsibility of the lubricant manufacturer.

Bosch Rexroth customarily tests all components with HLP mineral oil.

Bosch Rexroth will not accept liability for any damage to its components resulting from mixing hydraulic fluids!

4.6 Re-additivation

Additives added at a later point in time such as colors, wear reducers, VI enhancers or anti-foam additives, may negatively affect the performance properties of the hydraulic fluid and the compatibility with our components, and are not approved.

Bosch Rexroth will not accept liability for any damage to its components resulting from re-additivation!

4.7 Foaming behavior

Foam is created by rising air bubbles at the surface of hydraulic fluids in the reservoir. Foam that develops should collapse as quickly as possible.

The foaming behavior of fire-resistant, water-containing hydraulic fluids is normally worse than in HLP mineral oil.

4.8 Corrosion protection

Water generally has corrosive properties.

Corrosion protection is only possible to a limited extent due to the water content in fire-resistant, water-containing hydraulic fluids, despite the available corrosion protection additives.

Materials made of steel, copper, zinc, aluminum, bronze alloys and brass alloys, as well as combinations of these materials have a higher corrosion tendency.

4.9 Dissolved and undissolved air

Under atmospheric conditions, the hydraulic fluid contains dissolved air. In the negative pressure range, for instance in the suction pipe of the pump or downstream of control edges, this dissolved air may transform into undissolved air. The undissolved air content represents a risk of cavitation. The consequence of this is material erosion on components. With the correct measures, such as suction pipe and reservoir design, and an appropriate hydraulic fluid, air intake and separation can be positively influenced. See also section 3.1.7 "Air separation ability (ASA)".

4.10 Fluid servicing, fluid analysis, and filtration

To preserve the usage properties and ensure a long service life for hydraulic fluid and components, both the monitoring of the fluid condition and a filtration adapted to the application requirements are indispensable.

The application of hydraulic system filters with a filtration rate > 200 for $10\mu\text{m}$ particles ($\beta_{10(c)} > 200$ according to ISO 16889) is not recommended for fire-resistant, water-containing hydraulic fluids, since finer filters can break down the chemical composition of the fluid. If finer filters are required despite that, then the fluid manufacturer needs to be consulted before they are used.

$\beta_{10(c)} > 75$ according to ISO 16889 is recommended. The effort is higher in the case of unfavorable usage conditions, increased stress on the hydraulic system or high expectations as to availability and service life, see chapter 2 "Solid particle contamination and cleanliness levels".

When commissioning a system, please note that the required minimum cleanliness level can frequently be attained only by flushing the system. Due to severe start-up contamination, it may be possible that a fluid and/or filter replacement becomes necessary after a short operating period (< 50 operating hours).

The hydraulic fluid must be replaced at regular intervals and tested by the lubricant manufacturer or recognized, accredited test labs. A reference inspection is recommended both for the unused hydraulic fluid (casks) and after commissioning.

Minimum information in analyses (recommended)

Property or test conditions	Test method	HFAE	HFAS	HFB	HFC
Appearance		●	●	●	●
Water content	HFAE, HFB: ISO 3733 HFAS: ISO 6296; HFC: DIN 51777-1	●	●	●	●
Density at 15 °C	ISO 3675, DIN 51757 incl. supplementary sheet 1	–	–	●	●
pH value at 20 °C	ISO 20843	●	●	–	●
Viscosity at 20 °C, 40 °C, and 50 °C	ISO 3104, DIN 51562-1, ASTM D7042	●	●	●	●

Reserve alkalinity compared with pH values 3.3 and 5.5		●	●	●	●
Testing in the four-ball apparatus	ISO 20623	–	–	–	●
Air separation ability at 50 °C	ISO 9120	–	–	–	●

Information

- ▶ If possible, compare the measurement results with the values of new oil or available trend analyses.
- ▶ The test report should include an evaluation / assessment pertaining to the further use of the hydraulic fluid.

When using fire-resistant, water-containing hydraulic fluids, the same servicing and maintenance requirements as applied for HLP/HVLP mineral oil are necessary. However, the scope of the analysis/analysis methods have to be adapted to the fluid properties.

After changing over hydraulic fluids, it is recommended that the filter be replaced again after 50 operating hours as fluid aging products may have detached themselves (“self-cleaning effect”).

Fire-resistant, water-containing hydraulic fluids contain alkaline additives. They are used both for the neutralization of contamination and for corrosion protection in the hydraulic system. If the reserve alkalinity drops significantly below the value for the unused hydraulic fluid, there is a chance that fully developed, acidic reaction products can no longer be fully neutralized. The risk of electrochemical corrosion in the system increases, which is why the proportion of corrosion protection inhibitors have to be checked during operation (reserve alkalinity compared with pH values 3.3 and 5.5).

If the water contained has noticeably vaporized, then distilled water or VE water needs to be replenished in order to set the initial viscosity; tap water must never be used. The addition of larger quantities of water should be done slowly and, if possible, in several positions during ongoing operation, so as to prevent the pump from occasionally sucking in pure water, and thus being damaged by that. It is recommended that the corresponding amount of water prior to the addition be mixed with approximately the same amount of HFC fluid, for example.

Ultimately, the evaluation by the test lab or lubricant manufacturers is authoritative. Their recommendation should be urgently observed.

In case of warranty, liability, or guarantee claims to Bosch Rexroth, service verification and/or the results of fluid analyses are to be provided.

5 Disposal and environmental protection

All fire-resistant, water-containing hydraulic fluids, are, like mineral oil-based hydraulic fluids, subject to special disposal obligations.

The respective lubricant manufacturers provide specifications on environmentally friendly handling and storage. Please ensure that spilled or splashed fluids are absorbed with appropriate adsorbents or by a technique that prevents it contaminating water courses, the ground, or sewerage systems.

It is also not permitted to mix fluids when disposing of hydraulic fluids. Regulations governing the handling of used oils stipulate that used oils are not to be mixed with other products. Non-compliance will increase disposal costs.

Both the national legal or regulatory provisions and the information given in the respective safety data sheets (e.g. waste codes) must be observed for the disposal of the relevant hydraulic fluid.

6 Standardization

The information pertaining to the standards listed in this document relates to the respective standard edition currently valid.

7 Glossary

Additivation

Additives are chemical substances added to base fluids in small quantities to achieve or improve specific properties.

Alkaline additives

Hydraulic fluids can produce acids as a result of various aging processes. The hydraulic fluid contains alkaline additives in order to cushion/remove the acidification. These additives bind the acid residue and then become particles that are (can be) filtered out. A statement in regard of alkaline additives still effective is provided, on the one hand, by pH value, but better still is the statement pertaining to the content of free acids. In the alkaline pH value range, acidic corrosion is not possible, even if acids are present.

Aging

The aging response in a hydraulic fluid describes the chronological sequence of the oxidative, thermal, and (sometimes) hydrolytic change in selected chemical and physical data under test conditions or in practice. (See chapter 3.1.5 "Aging resistance").

Arrhenius equation

The quantitative relation between reaction rate and temperature is described by an exponential function, the Arrhenius equation. This function is usually visualized within the typical temperature range of the hydraulic system.

ICP (optical emission spectrometry)

The ICP procedure can be used to determine various wear metals, contamination types, and additives. Practically all elements in the periodic system can be detected with this method.

Karl Fischer method

Method for determining the proportion of water in water-containing hydraulic fluids: potentiometric method according to DIN 51777-1

Cavitation

Cavitation is the creation of vapor filled cavities (vapor bubbles) in fluids due to insufficient vapor pressure and subsequent implosion when the pressure increases. When the cavities implode, extremely high acceleration, temperatures, and pressures may occur temporarily, which may damage the component surfaces.

Reserve alkalinity

Determining the reserve alkalinity is used for the investigation of the corrosion protection still available. If the determined reserve alkalinity significantly drops below the initial value of the new oil, then acidic contamination can no longer be neutralized, this means that there is a potential threat to the system becoming damaged due to corrosion.

pH value

This is the measurement for the acidic or alkaline character of an aqueous solution or emulsion.

Pour point

This is the lowest temperature at which the fluid still just flows when cooled down under set conditions. The pour point is specified in the lubricant manufacturers' technical data sheets as a reference value for achieving this flow limit.

RFA (energy dispersive or wavelength dispersive X-ray fluorescence analysis)

Is a procedure to determine almost all elements in liquid and solid samples with nearly any composition. This analysis method is suitable for examining additives and contamination, delivering fast results.

VE water

Demineralized water, also known as deionized, fully desalinated water

Viscosity

Viscosity is the measure of the internal friction of a fluid to flow. It is defined as the property of a substance to flow under tension. Viscosity is the most important characteristic for describing the load-bearing capacity of a hydraulic fluid.

Kinematic viscosity is the ratio of the dynamic viscosity and the density of the fluid; the unit is mm^2/s . Hydraulic fluids are categorized in ISO viscosity classes by kinematic viscosity. The reference temperature for this is 40 °C.

Viscosity index (VI)

Refers to the viscosity temperature behavior of a fluid. The lower the change of viscosity in relation the temperature, the higher the VI.

Axial piston units for operation with fire-resistant hydraulic fluids - water-free and water-containing (HFDR, HFDU, HFA, HFB, HFC)

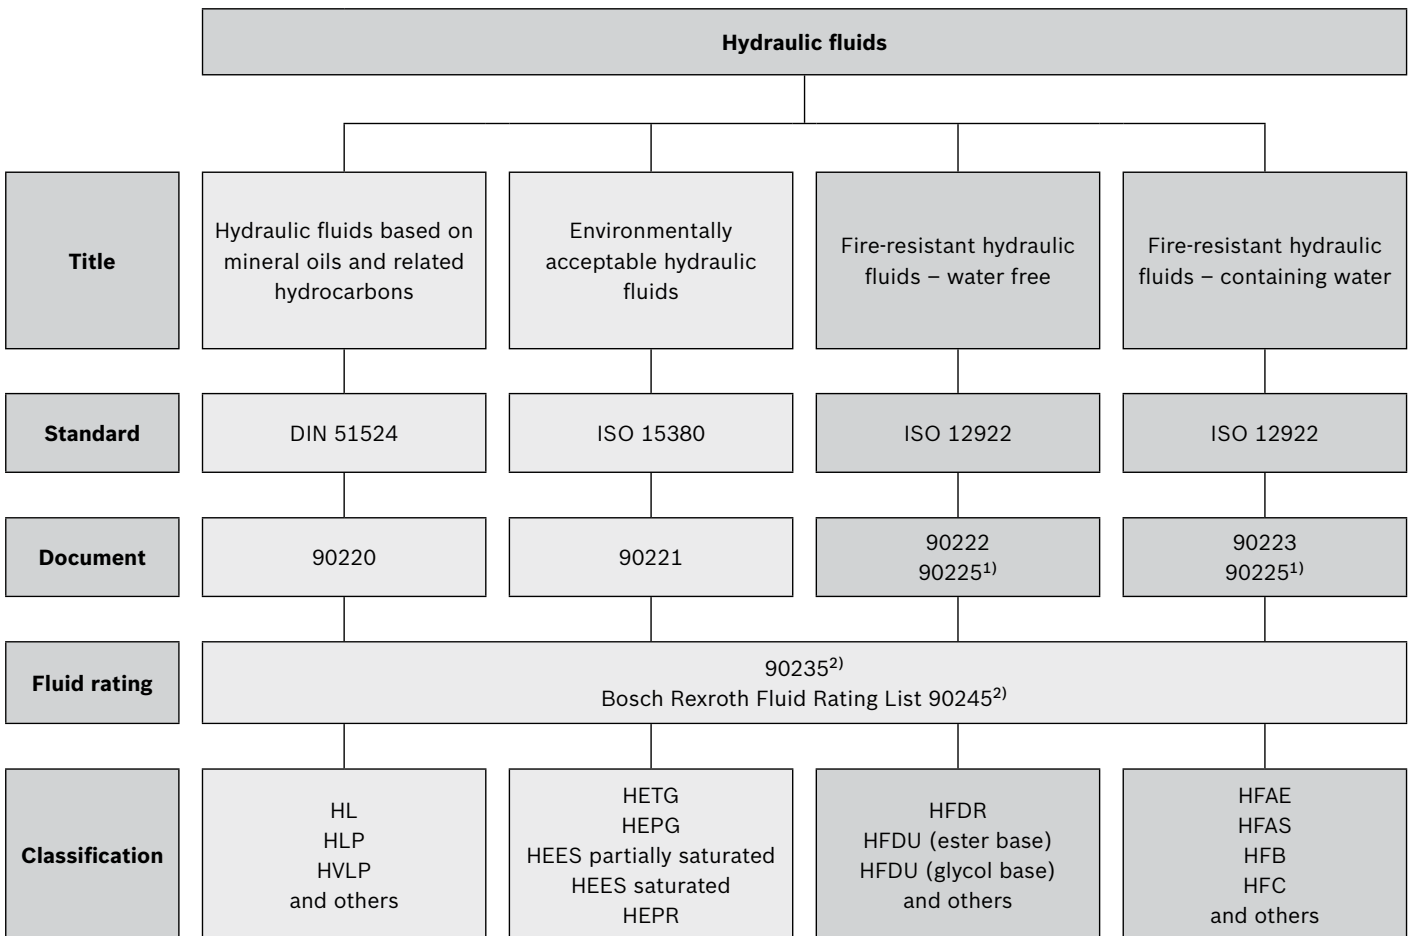

RE 90225

Edition: 07.2016

1

Application requirements and technical data for axial piston units

1) Valid for Bosch Rexroth axial piston units

2) Valid for Bosch Rexroth Business Unit "Mobile Applications" – pumps and motors

1 Basic information

In accordance with DIN 51502 and DIN EN ISO 6743-4, fire resistant fluids – hereinafter referred to as HF hydraulic fluids – are divided into four groups A, B, C, D and correspondingly designated HFA, HFB, HFC, HFD. In the designation “HF”, the “H” for “hydraulic fluid” and “F” is for “fire resistant”.

In general, fire-resistant hydraulic fluids are divided into water-free, fire-resistant hydraulic fluids and water-containing, fire-resistant hydraulic fluids. The water-free, fire-resistant hydraulic fluids are described in Rexroth data sheet 90222, the water-containing ones are described in Rexroth data sheet 90223.

Compared with hydraulic fluids based on mineral oils and related hydrocarbons, fire-resistant hydraulic fluids do have other, sometimes disadvantageous, properties. This document is intended to show how these special properties have to be considered in the selection and operation of axial piston units.

For axial piston units which may, in accordance with product data sheet, be operated with fire-resistant hydraulic fluids, note the following:

- ▶ The operation with HFA, HFB and HFC hydraulic fluids usually requires a reduction in the permissible pressures and rotational speeds. Depending on the product size or nominal size, a special version of the axial piston unit is needed (version **E**-...). However, Rexroth hydraulic components that have been specifically developed for water-containing, fire-resistant hydraulic fluids are available without limitation of operational data (e.g. 92053 axial piston variable pump A4VSO for HFC hydraulic fluids).
- ▶ When using hydraulic fluids of the category HFDR (ester base), there are permissible standard values for pressure and rotational speed for these axial piston units just as there are for hydraulic fluids based on mineral oils and related hydrocarbons. For operation with HFDR and HFDR (glycol base), for example, a reduction in the permissible rotational speeds results from the significantly higher density of the fluid.
- ▶ Note that for almost all HF hydraulic fluids, due to the higher density compared with hydraulic fluids based on mineral oils, the pressure will not fall below the minimum permissible suction pressure at the pump inlet.

- ▶ Additional technical data and required sealing materials for the axial piston units are listed in the table on page 4.

When ordering the axial piston unit, please state in plain text the hydraulic fluid that is to be used.

2 Classification of HF-hydraulic fluids

Classification	Containing water					Water-free		
	HFAE	HFAS	HFB	HFC	HFC-E ³⁾	HFDR	HFDU ⁴⁾ (Glycol base)	HFDU (Ester base)
Features	Oil-in-water emulsions	Chemical solutions in water	Water-in-oil emulsions	Watery polymer solutions	Watery polymer solutions	Basic fluids	Basic fluids	Basic fluids
						Phosphoric acid ester	Glycols	Ester
Water content [% (m/m)]	≥ 95	≥ 95	≥ 40	≥ 35	≥ 20±2	–	–	–
Reservoir temperature T [°C]	5 to 50	5 to 50	5 to 50	-20 to 50	-20 to 70	80	80	80
Optimal reservoir temperature T_{opt} [°C]	40	40	40	40	40	70	70	70
Bearing service life ¹⁾ [%]	10	10	20	100 ²⁾ 20	100 ²⁾ 20	100	100	100
Cleanliness level acc. to ISO 4406	– / 18 / 15	– / 18 / 15	– / 18 / 15	– / 18 / 15	– / 18 / 15	20 / 18 / 15	20 / 18 / 15	20 / 18 / 15
Filter material	Glass fiber, do not use cellulose (filter paper)					–	–	–
Sealing material	NBR	NBR	NBR	NBR	NBR	FKM	FKM	FKM
Minimum suction pressure Port S $p_{s min}$ [bar] (operation as a pump, open circuit)	1.0 (abs.)	1.0 (abs.)	1.0 (abs.)	1.0 (abs.)	1.0 (abs.)	1.0 (abs.)	1.0 (abs.)	1.0 (abs.)

Notice

- ▶ Sealing material and filter grade is to be agreed upon with the manufacturer of the hydraulic fluid or with Bosch Rexroth Filtration System.
Link: Bosch Rexroth Filtration System
- ▶ Compared to hydraulic fluids based on mineral oils, HFC hydraulic fluids have a very good low-temperature performance, a lower pour point and a lower viscosity-pressure coefficients.
- ▶ Bosch Rexroth offers the rating of hydraulic fluids for Rexroth hydraulic components as a service. You can find further information on this in the following data sheet:
90235: Rating of hydraulic fluids for Rexroth hydraulic components

1) Attainable bearing service life based on operation with hydraulic fluids based on mineral oils, according to the specifications of the bearing manufacturer.
Practical application cases show results that are much higher.

2) Axial piston variable pump A4VSO for HFC hydraulic fluids, see document 92053
3) Not standardized according to ISO 12922.
4) Can be water-soluble

3 Technical data for axial piston units operating with HF-hydraulic fluids

Notice

- ▶ Maximum permissible rotational speeds
- ▶ In the following tables, HFA includes HFAE and HFAS
- ▶ Nominal pressure/maximum pressure for HFD corresponds to the specifications for mineral oil; see product data sheet
- ▶ For HFDU (ester and glycol) as well as for HFDR, there is no pressure limitation
- ▶ For HFDR and HFDU (glycol), the maximum allowable rotational speed must be reduced due to the high density of the hydraulic fluid
- ▶ The manufacturer's specifications concerning the suction performance, the temperatures, the working pressures and the rotational speeds are to be strictly adhered to for a long service life of the axial piston unit

3.1 Swashplate pumps for open circuit

Variable pump A4VSO series 1x and series 30

Rating of hydraulic fluids for Rexroth hydraulic components (pumps and motors)

RE 90235

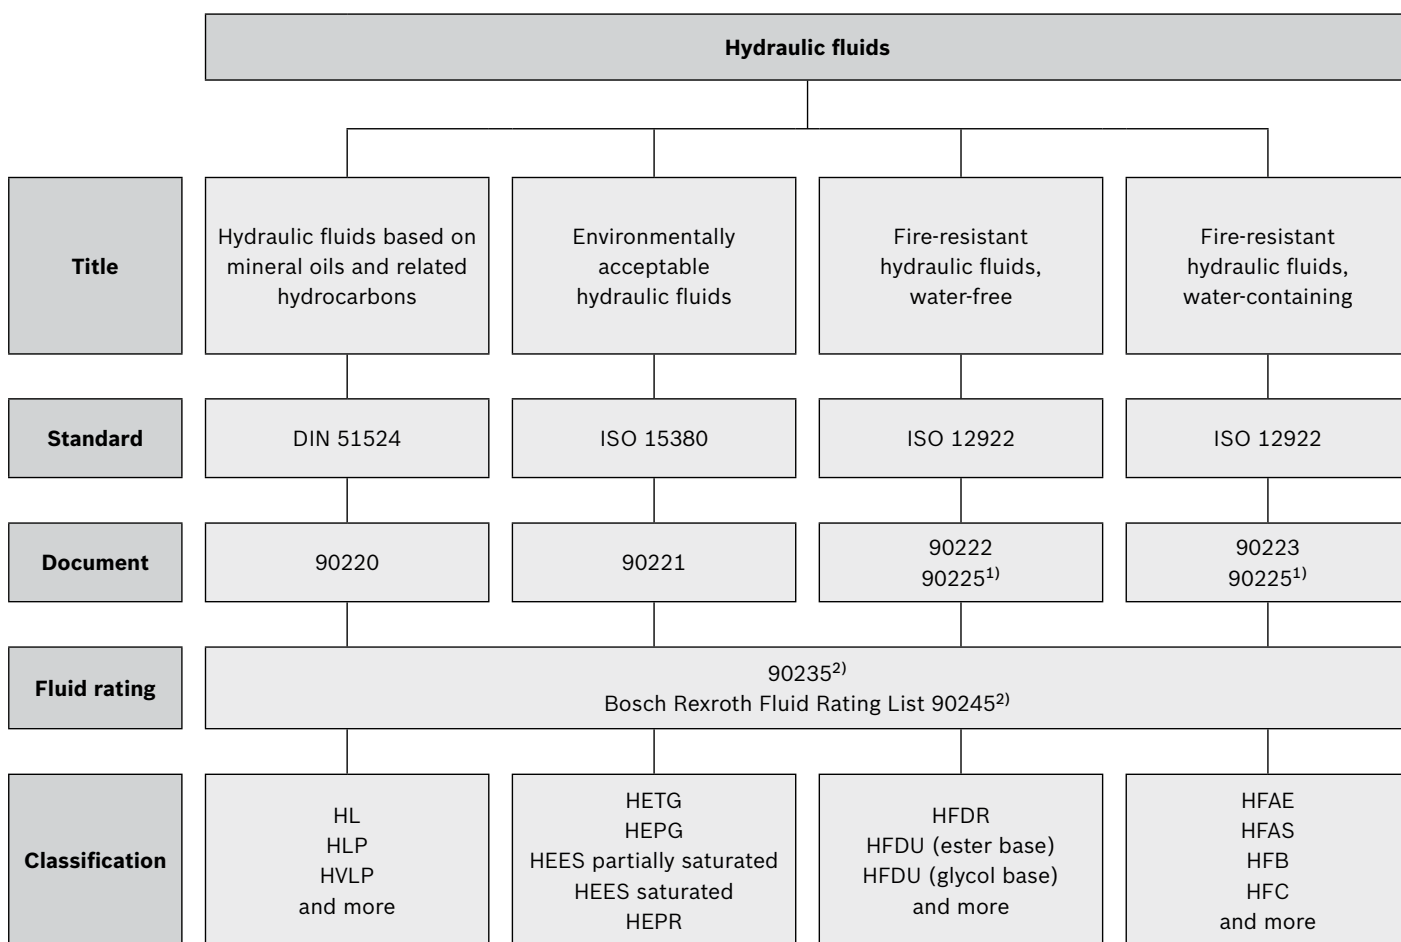

Edition: 02.2015

Replaces 01.2013

1

Bosch Rexroth offers the rating of hydraulic fluids as service – inclusive assistance and consulting of experienced engineers.

1) Valid for Bosch Rexroth axial piston units

2) Valid for Bosch Rexroth Business Unit "Mobile Applications" – pumps and motors

The safe and reliable operation of industrial and mobile equipment is only possible if the hydraulic fluid used is selected with respect to the application. The main tasks of the hydraulic fluid are e.g. transmission of power, lubrication of the components, reduction of friction, corrosion prevention and heat dissipation. Unfortunately the common element "hydraulic fluid" is often disregarded during conceptual design.

Increased requirements on machines and equipment constantly raise the quality requirements on the hydraulic fluid used. For using a suitable hydraulic fluid, adequate knowledge and experience of this are necessary.

Therefore Bosch Rexroth offers the rating of hydraulic fluids for Rexroth hydraulic components as service.

Bosch Rexroth defines hydraulic fluids on the basis of the illustration on page 1. Application notes and requirements for Rexroth hydraulic components can be taken out of the data sheets mentioned in this illustration on page 1.

1 Description

Minimum requirements

At present the standards conformity for the minimum requirement on fluids is defined in our Bosch Rexroth component data sheets. The fluid manufacturers' technical data sheets have to include that the specific standards are met. The plausibility and correctness of the fluid data are not reviewed by Bosch Rexroth.

Bosch Rexroth Fluid Rating

Fluid data of the manufacturer has to be according to ISO (selected characteristic values of standards) and Bosch Rexroth requirements (tightened values of standards and extended Bosch Rexroth requirements). Bosch Rexroth demands the data to be confirmed in writing. The plausibility and correctness of the fluid data is reviewed by Bosch Rexroth.

The extended Bosch Rexroth requirements are beneath others specific fluid tests, that show suitability of the hydraulic fluid with defined Rexroth components and which are constituents of the respective specification.

Depending on the utilized Rexroth hydraulic components and the oil type, the corresponding fluid test has to be passed prior to the assignment of the Bosch Rexroth fluid rating.

Retention samples (finished oil, base oil) are furthermore saved. The hydraulic fluids that fulfill the Bosch Rexroth Fluid Rating requirements will be listed on the following Bosch Rexroth document.

► 90245: Bosch Rexroth Fluid Rating List

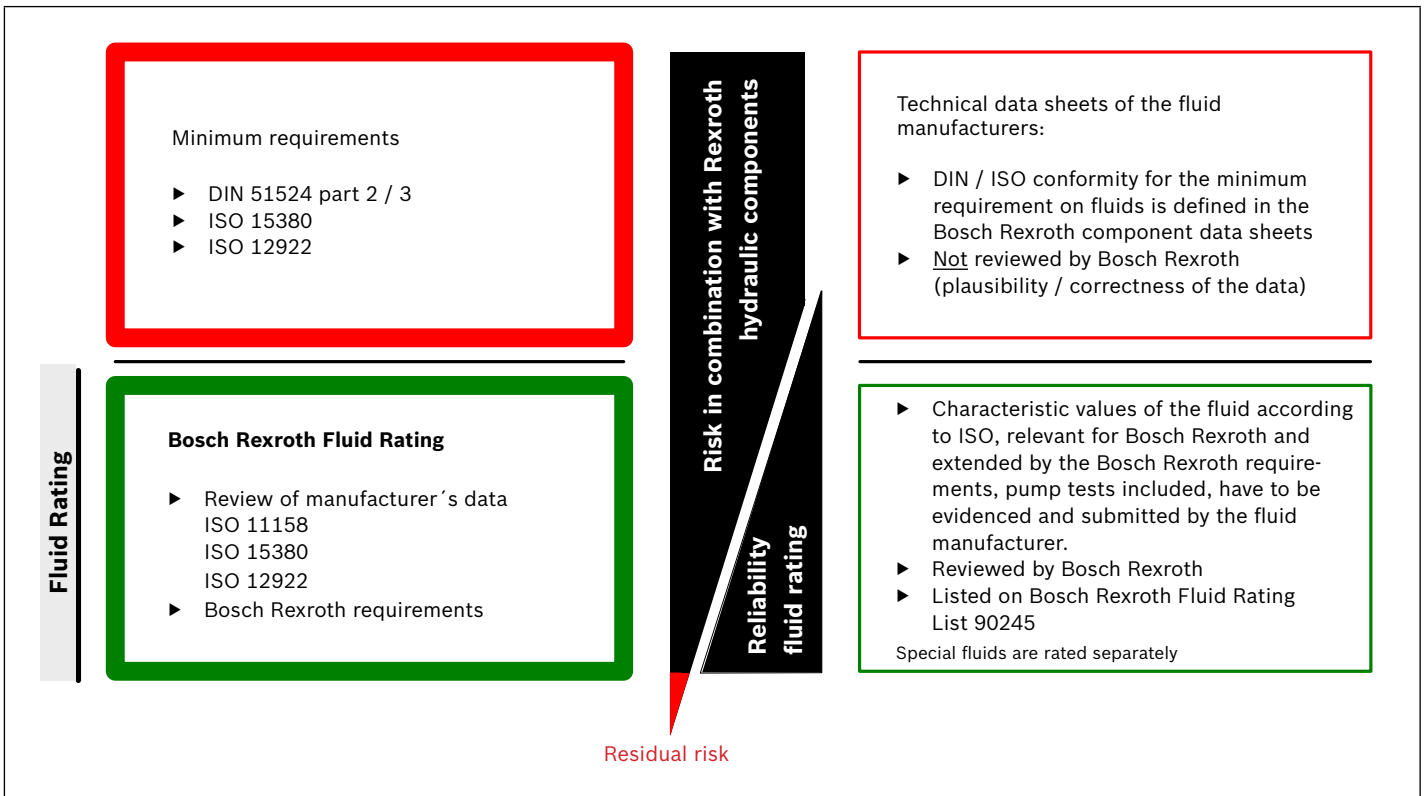

Note

The Bosch Rexroth Fluid Rating requirements cannot cover all machine and system-dependent conditions (see residual risk on rating scheme on page 3). Only single Rexroth components pumps/motors can be examined in the fluid tests. Bosch Rexroth Fluid Rating does not cover all systems and applications.

Releases for special applications are excluded from the Bosch Rexroth Fluid Rating.

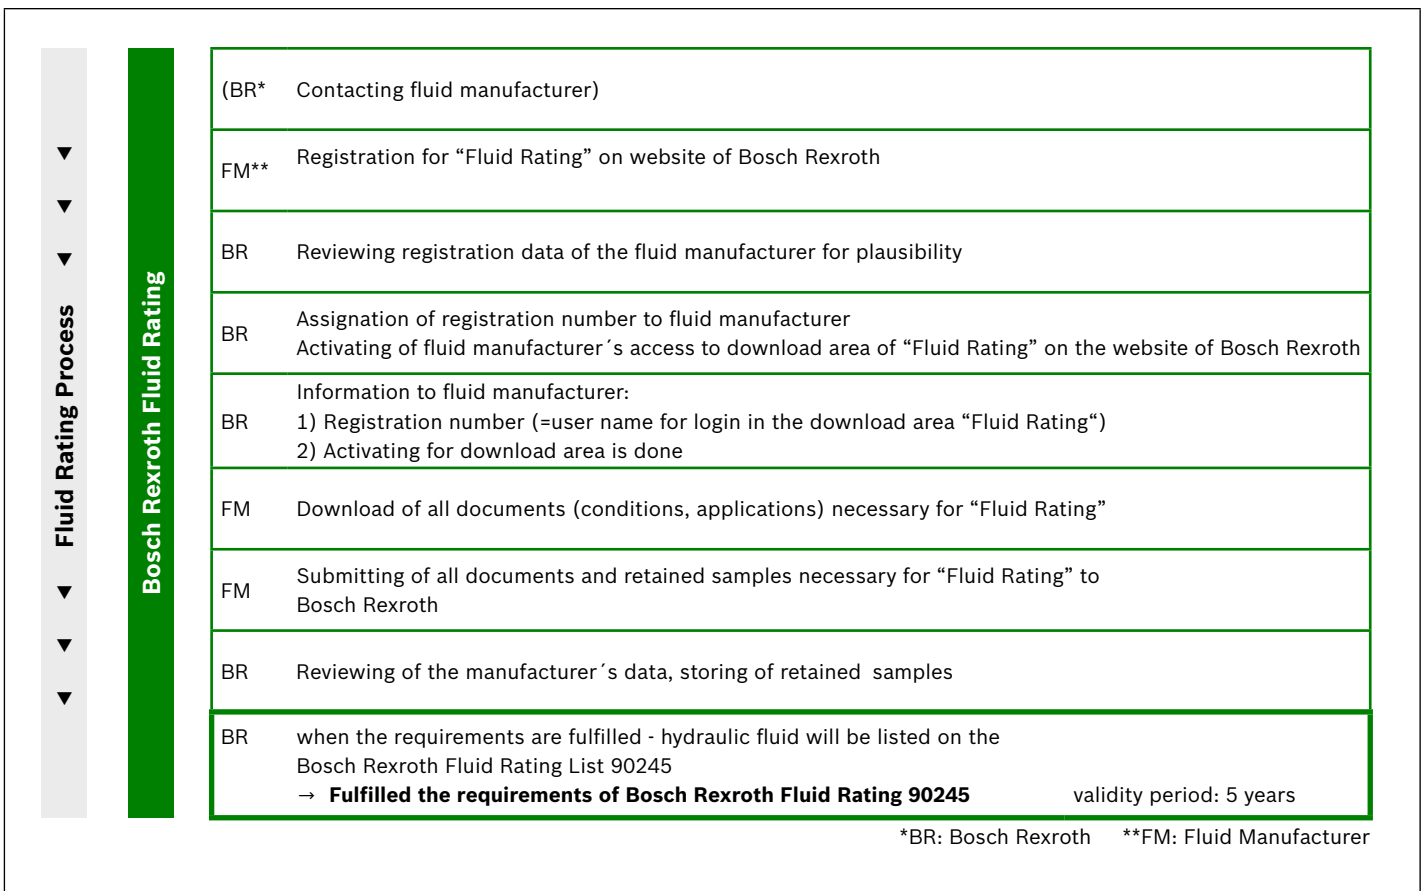

The responsibility for selection of the hydraulic fluid remains with the equipment/machinery operator and the fluid manufacturer.

By means of the requirements contained in the Bosch Rexroth Fluid Rating the risk of using hydraulic fluid in combination with Rexroth hydraulic components can be considerably reduced and the reliability significantly increased.

2 Process

The process of a Fluid Rating includes the following steps:

3 Fluid tests

3.1 Requests for Fluid Tests

Two different fluid tests may presently be requested by Bosch Rexroth:

- ▶ RFT-APU-CL Rexroth Fluid Test Axial Piston Unit Closed Loop (see **3.2**)
- ▶ RFT-APU-OL-HFC Rexroth Fluid Test Axial Piston Unit Open Loop-HFC (see **3.3**)

These tests may be requested independent of the Bosch Rexroth Fluid Rating. They are, however, a permanent specification of the Bosch Rexroth Fluid Rating.

Prior to the request for the Bosch Rexroth Fluid Rating the fluid test, required in the respective specification, has to be terminated positively.

The process of the fluid test includes the following steps:

FM	Request for quotation for fluid test by Bosch Rexroth			
FM	Commissioning of fluid test, submission of further documents and supplying of the fluid for the test			
BR	Implementation of the requested fluid test using defined Rexroth components	RFT-APU-CL Rexroth Fluid Test - Axial Piston Unit Closed Loop	RFT-APU-OL-HFC Rexroth Fluid Test - Axial Piston Unit Open Loop-HFC	Further fluid tests in preparation

*BR: Bosch Rexroth **FM: Fluid Manufacturer

3.2 Rexroth fluid test RFT-APU-CL

(Rexroth Fluid Test Axial Piston Unit Closed Loop)

Fluid test for closed loop applications using a combination of units consisting of a hydraulic pump A4VG045EP and a hydraulic motor A6VM060EP. This fluid test represents the requirements on a hydrostatic transmission.

Features of the fluid test

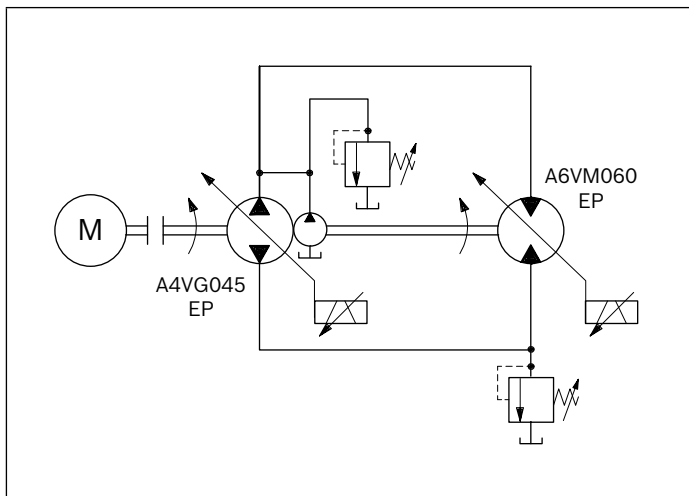

The suitability of the hydraulic fluid is tested at high stress under laboratory conditions. The fluid test consists of a break-in test, swivel cycle test and a corner power test.

Rating criteria

- ▶ Examination of the interaction fluid / component
 - Measurement of the component weight change respectively dimensional change
 - Material compatibility
 - Visual inspection of components /component surfaces
 - Oil analysis (start of test (SOT), during test, end of test (EOT))
- ▶ Evidence of endurance performance
- ▶ Determination of efficiency (SOT, EOT)

3.3 Rexroth fluid test RFT-APU-OL-HFC

(Rexroth Fluid Test Axial Piston Unit Open Loop-HFC)

Fluid test for open loop applications using a combination of units consisting of a A4VSO swashplate axial piston combination unit (hydraulic pump and hydraulic motor) as well as an EA10VSO/31 hydraulic pump. This fluid test represents the requirements on applications demanding water-containing, fire-resistant hydraulic fluids of the HFC classification.

Features of the fluid test

The suitability of the hydraulic fluid is tested at high stress under laboratory conditions. The fluid test consists of a constant and swivel cycle test.

Rating criteria

- ▶ Examination of the interaction fluid / component
 - Wear and cavitation behaviour
 - Material compatibility
 - Visual inspection of components /component surfaces
 - Measuring records of functional relevant component surfaces
 - Oil analysis (SOT, during test, EOT)
- ▶ Evidence of endurance performance

Features

- Fixed motor with axial tapered piston rotary group of bent-axis design, for hydrostatic drives in open and closed circuits
- For use in mobile and stationary applications
- The output speed is dependent on the flow of the pump and the displacement of the motor.
- The output torque increases with the pressure differential between the high-pressure and the low-pressure side.
- Finely graduated sizes permit far-reaching adaptation to the drive case
- High power density
- Small dimensions
- High total efficiency
- Good starting characteristics
- Economical design
- One-piece tapered piston with piston rings for sealing

Technical data

Hydraulic fluid

Before starting project planning, please refer to our data sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable hydraulic fluids), RE 90222 (HFD hydraulic fluids) and RE 90223 (HFA, HFB, HFC hydraulic fluids) for detailed information regarding the choice of hydraulic fluid and application conditions.

The fixed motor A2FM is not suitable for operation with HFA hydraulic fluid. If HFB, HFC or HFD or environmentally acceptable hydraulic fluids are used, the limitations regarding technical data or other seals must be observed.

Selection diagram

Details regarding the choice of hydraulic fluid

The correct choice of hydraulic fluid requires knowledge of the operating temperature in relation to the ambient temperature: in a closed circuit, the circuit temperature, in an open circuit, the reservoir temperature.

The hydraulic fluid should be chosen so that the operating viscosity in the operating temperature range is within the optimum range (ν_{opt} see shaded area of the selection diagram). We recommended that the higher viscosity class be selected in each case.

Example: At an ambient temperature of X °C, an operating temperature of 60 °C is set in the circuit. In the optimum operating viscosity range (ν_{opt} , shaded area), this corresponds to the viscosity classes VG 46 or VG 68; to be selected: VG 68.

Note

The case drain temperature, which is affected by pressure and speed, can be higher than the circuit temperature or reservoir temperature. At no point of the component may the temperature be higher than 115 °C. The temperature difference specified below is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend flushing the case at port U (sizes 250 to 1000) or using a flushing and boost pressure valve (see pages 34).

Viscosity and temperature of hydraulic fluid

	Viscosity [mm ² /s]	Temperature	Comment
Transport and storage at ambient temperature		$T_{min} \geq -50^\circ\text{C}$ $T_{opt} = +5^\circ\text{C}$ to $+20^\circ\text{C}$	factory preservation: up to 12 months with standard, up to 24 months with long-term
(Cold) start-up ¹⁾	$\nu_{max} = 1600$	$T_{St} \geq -40^\circ\text{C}$	$t \leq 3$ min, without load ($p \leq 50$ bar), $n \leq 1000$ rpm (for sizes 5 to 200), $n \leq 0.25 \cdot n_{nom}$ (for sizes 250 to 1000)
Permissible temperature difference		$\Delta T \leq 25$ K	between axial piston unit and hydraulic fluid
Warm-up phase	$\nu < 1600$ to 400	$T = -40^\circ\text{C}$ to -25°C	at $p \leq 0.7 \cdot p_{nom}$, $n \leq 0.5 \cdot n_{nom}$ and $t \leq 15$ min
Operating phase			
Temperature difference		$\Delta T = \text{approx. } 12$ K	between hydraulic fluid in the bearing and at port T.
Maximum temperature		115 °C	in the bearing
		103 °C	measured at port T
Continuous operation	$\nu = 400$ to 10 $\nu_{opt} = 36$ to 16	$T = -25^\circ\text{C}$ to $+90^\circ\text{C}$	measured at port T, no restriction within the permissible data
Short-term operation ²⁾	$\nu_{min} \geq 7$	$T_{max} = +103^\circ\text{C}$	measured at port T, $t < 3$ min, $p < 0.3 \cdot p_{nom}$
FKM shaft seal ¹⁾		$T \leq +115^\circ\text{C}$	see page 5

1) At temperatures below -25°C , an NBR shaft seal is required (permissible temperature range: -40°C to $+90^\circ\text{C}$).

2) Sizes 250 to 1000, please contact us.

Technical data

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

To ensure the functional reliability of the axial piston unit, a gravimetric analysis of the hydraulic fluid is necessary to determine the amount of solid contaminant and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 is to be maintained.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

If the above classes cannot be achieved, please contact us.

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the speed of the axial piston unit and the case drain pressure (case pressure). The mean differential pressure of 2 bar between the case and the ambient pressure may not be enduringly exceeded at normal operating temperature. For a higher differential pressure at reduced speed, see diagram. Momentary pressure spikes ($t < 0.1$ s) of up to 10 bar are permitted. The service life of the shaft seal decreases with an increase in the frequency of pressure spikes.

The case pressure must be equal to or higher than the ambient pressure.

Sizes 10 to 200

Sizes 250 to 1000

The values are valid for an ambient pressure $p_{\text{abs}} = 1$ bar.

Temperature range

The FKM shaft seal may be used for case drain temperatures from -25 °C to +115 °C.

Note

For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C). State NBR shaft seal in plain text when ordering. Please contact us.

Direction of flow

Direction of rotation, viewed on drive shaft

clockwise	counter-clockwise
A to B	B to A

Speed range

No limit to minimum speed n_{min} . If uniformity of motion is required, speed n_{min} must not be less than 50 rpm. See table of values on page 7 for maximum speed.

Long-life bearing

Sizes 250 to 1000

For long service life and use with HF hydraulic fluids. Identical external dimensions as motor with standard bearings. Subsequent conversion to long-life bearings is possible. Bearing and case flushing via port U is recommended.

Flushing flow (recommended)

NG	250	355	500	710	1000

Rate of pressure change $R_{A\ max}$

with integrated pressure-relief valve _____ 9000 bar/s

without pressure-relief valve _____ 16000 bar/s

Note

Values for other hydraulic fluids, please contact us.

Minimum pressure – pump mode (inlet)

To prevent damage to the axial piston motor in pump operating mode (change of high-pressure side with unchanged direction of rotation, e. g. when braking), a minimum pressure must be guaranteed at the service line port (inlet). The minimum pressure depends on the speed of the axial piston unit (see characteristic curve below).

This diagram is valid only for the optimum viscosity range from $v_{opt} = 36$ to $16\text{ mm}^2/\text{s}$.

Please contact us if these conditions cannot be satisfied.

Definition

Nominal pressure p_{nom}

The nominal pressure corresponds to the maximum design pressure.

Maximum pressure p_{max}

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

Minimum pressure (high-pressure side)

Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

Summation pressure p_{Su}

The summation pressure is the sum of the pressures at both service line ports (A and B).

Rate of pressure change R_A

Maximum permissible rate of pressure rise and reduction during a pressure change over the entire pressure range.

$$\text{Total operating period} = t_1 + t_2 + \dots + t_n$$

- 1) The values are valid:
 - for the optimum viscosity range from $\nu_{opt} = 36$ to 16 mm²/s
 - with hydraulic fluid based on mineral oils
- 2) Intermittent maximum speed: overspeed for unload and overhauling processes, $t < 5$ s and $\Delta p < 150$ bar
- 3) Restriction of input flow with counterbalance valve, see page 39
- 4) Torque without radial force, with radial force see page 8
- 5) Torque at $\Delta p = 315$ bar

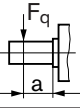

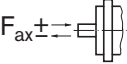

Note

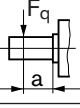

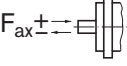

Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, with respect to speed variation, reduced angular acceleration as a function of the frequency and the permissible start up angular acceleration (lower than the maximum angular acceleration) can be found in data sheet RE 90261.

1) With intermittent operation

2) Maximum permissible axial force during standstill or when the axial piston unit is operating in non-pressurized condition.

3) Conical shaft with threaded pin and woodruff key (DIN 6888)

4) Restricted technical data only for splined shaft

5) Please contact us.

6) When at a standstill or when axial piston unit operating in non-pressurized conditions. Higher forces are permissible when under pressure, please contact us.

Note

Influence of the direction of the permissible axial force:

+F_{ax max} = Increase in service life of bearings

-F_{ax max} = Reduction in service life of bearings (avoid)

Technical data

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

	Toothed gear drive	V-belt output
NG	φ_{opt}	φ_{opt}
5 to 180	$\pm 70^\circ$	$\pm 45^\circ$
200 to 1000	$\pm 45^\circ$	$\pm 70^\circ$

Determining the operating characteristics

Input flow $q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v}$ [L/min]

Speed $n = \frac{q_v \cdot 1000 \cdot \eta_v}{V_g}$ [min⁻¹]

Torque $T = \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi}$ [Nm]

Power $P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600}$ [kW]

V_g = Displacement per revolution in cm³

Δp = Differential pressure in bar

n = Speed in rpm

η_v = Volumetric efficiency

η_{mh} = Mechanical-hydraulic efficiency

η_t = Total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

Dimensions size 5

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Flushing and boost pressure valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

The flushing and boost pressure valve is used to remove heat from the hydraulic circuit.

In an open circuit, it is used only for flushing the housing.

In a closed circuit, it ensures a minimum boost pressure level in addition to the case flushing.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the case drain fluid. The hydraulic fluid, removed out of the closed circuit must be replaced by cooled hydraulic fluid from the boost pump.

With port plate 027, the valve is mounted directly on the fixed motor (sizes 45 to 180, 250); with port plate 017 (sizes 355 and 500) on a plate.

Cracking pressure of pressure retaining valve

(observe when setting the primary valve)

Sizes 45 to 500, fixed setting _____ 16 bar

Switching pressure of flushing piston Δp

Sizes 45 to 500 _____ 8 ± 1 bar

Flushing flow q_v

Orifice (throttles with integrated valve) can be used to set the flushing flows as required.

Following parameters are based on:

$$\Delta p_{ND} = p_{ND} - p_G = 25 \text{ bar and } v = 10 \text{ mm}^2/\text{s}$$

(p_{ND} = low pressure, p_G = case pressure)

Schematic

Standard flushing flows

Flushing and boost pressure valve, mounted (code 7)

Size	Flushing flow q_v [L/min]	ϕ [mm]	Mat. No. of orifice
45	3.5	1.2	R909651766
107, 125	8	1.8	R909419696
160, 180	10	2.0	R909419697
250	10	2.0	R909419697
355, 500	16	2.5	R910803019

With sizes 45 to 180, orifices can be supplied for flushing flows from 3.5 to 10 L/min. For other flushing flows, please state the required flushing flow when ordering. The flushing flow without orifice is approx. 12 to 14 L at low pressure $\Delta p_{ND} = 25$ bar.

Flushing and boost pressure valve, integrated (code 9)

2

Pressure-relief valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

The MHDB pressure-relief valves (see RE 64642) protect the hydraulic motor from overload. As soon as the set cracking pressure is reached, the hydraulic fluid flows from the high-pressure side to the low-pressure side.

The pressure-relief valves are only available in combination with port plates 181, 191 or 192 (counterbalance valve for mounting to port plate 181: see next page).

Cracking pressure setting range _____ 50 to 420 bar

With the version "with pressure boost facility" (192), a higher pressure setting can be realized by applying an external pilot pressure of 25 to 30 bar to port P_{St} .

When ordering, please state in plain text:

- Cracking pressure of pressure-relief valve
- Cracking pressure with pilot pressure applied to P_{St} (only with version 192)

Version without pressure boost facility "191"

Version with pressure boost facility "192"

Counterbalance valve BVD and BVE

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Function

Travel drive/winch counterbalance valves are designed to reduce the danger of overspeeding and cavitation of axial piston motors in open circuits. Cavitation occurs if the motor speed is greater than it should be for the given input flow while braking, travelling downhill, or lowering a load.

If the inlet pressure drops, the counterbalance spool throttles the return flow and brakes the motor until the inlet pressure returns to approx. 20 bar.

Note

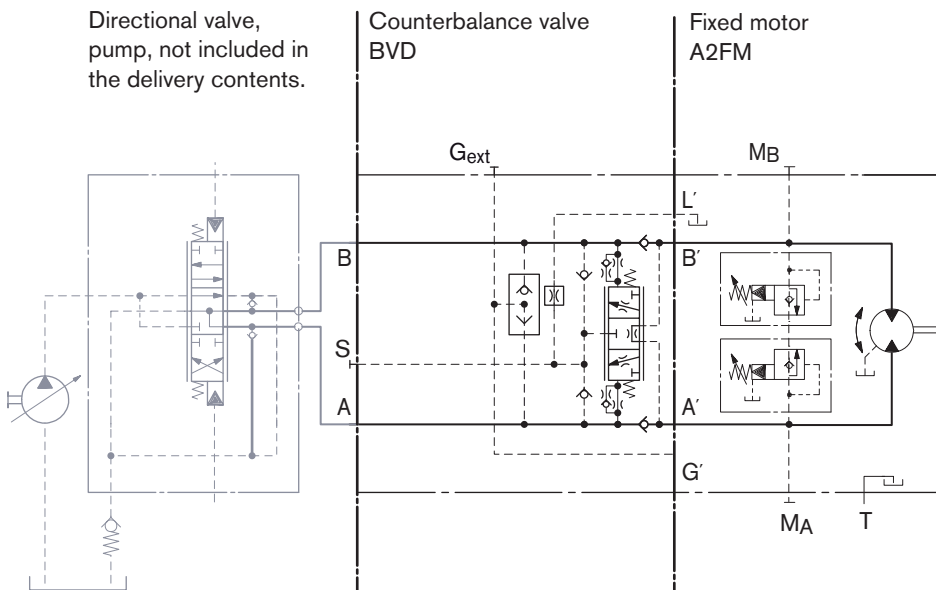

- BVD available for sizes 28 to 180 and BVE available for sizes 107 to 180.
- The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set. Ordering example: A2FM90/61W-VAB188 + BVD20F27S/41B-V03K16D0400S12
- The counterbalance valve does not replace the mechanical service brake and park brake.
- Observe the detailed notes on the BVD counterbalance valve in RE 95522 and BVE counterbalance valve in RE 95525!
- For the design of the brake release valve, we must know for the mechanical park brake:
 - the pressure at the start of opening
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

Travel drive counterbalance valve BVD...F

Application option

- Travel drive on wheeled excavators

Example schematic for travel drive on wheeled excavators A2FM090/61W-VAB188 + BVD20F27S/41B-V03K16D0400S12

2) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

3) The spot face can be deeper than specified in the appropriate standard.

4) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

Counterbalance valve BVD and BVE

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Mounting the counterbalance valve

When delivered, the counterbalance valve is mounted to the motor with two tacking screws (transport protection). The tacking screws may not be removed while mounting the service lines. If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be mounted to the motor port plate using the provided tacking screws. The counterbalance valve is finally mounted to the motor by screwing on the SAE flange with the following screws:

6 screws (1, 2, 3, 4, 5, 8) _____ length $B1+B2+B3$
 2 screws (6, 7) _____ length $B3+B4$

Tighten the screws in two steps in the specified sequence from 1 to 8 (see following scheme).

In the first step, the screws must be tightened with half the tightening torque, and in the second step with the maximum tightening torque (see following table).

Thread	Strength class	Tightening torque [Nm]
M6 x 1 (tacking screw)	10.9	15.5
M10	10.9	75
M12	10.9	130
M14	10.9	205

Size	28, 32, 45	56, 63	80, 90	107, 125, 160, 180	107, 125

1) Minimum required thread reach $1 \times \varnothing$ -thread

2) Including sandwich plate

Speed sensors

The versions A2FM...U and A2FM...F ("prepared for speed sensor", i.e. without sensor) is equipped with a toothed ring on the rotary group.

On deliveries "prepared for speed sensor", the port is plugged with a pressure-resistant cover.

With the DSA or HDD speed sensor mounted a signal proportional to motor speed can be generated.

The sensors measures the speed and direction of rotation.

Ordering code, technical data, dimensions and details on the connector, plus safety information about the sensor can be found in the relevant data sheet.

DSA _____ RE 95133

HDD _____ RE 35135

The sensor is mounted at the specially provided port D as follows:

DSA _____ with one mounting bolt

HDD _____ with two mounting bolts

We recommend ordering the A2FM fixed motor complete with sensor mounted.

Version "V"

Installation instructions

General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

Particularly in the installation position "drive shaft upwards" filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The case drain fluid in the motor housing must be directed to the reservoir via the highest available drain port (T_1 , T_2).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the minimum permissible case pressure of all connected units is not exceeded in any situation. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Installation position

See the following examples 1 to 8.

Further installation positions are possible upon request.

Recommended installation positions: 1 and 2.

Note

With sizes 10 to 200 with installation position "shaft upward", an air-bleed port R is required (state in plain text when ordering - special version). With sizes 250 to 1000, port U is provided as standard in the area near the bearings for air bleeding.

Installation position	Air bleed	Filling
1	-	T_1
2	-	T_2
3	-	T_1
4	R (U)	T_2
5	L_1	T_1 (L_1)
6	L_1	T_2 (L_1)
7	L_1	T_1 (L_1)
8	R (U)	T_2 (L_1)

L_1 Filling / air bleed

R Air bleed port (special version)

U Bearing flushing / air bleed port

T_1 , T_2 Drain port

$h_{t \text{ min}}$ Minimum required immersion depth (200 mm)

h_{min} Minimum required spacing to reservoir bottom (100 mm)

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Recommendation for installation position 8 (drive shaft upward): A check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the motor housing.

General instructions

- The motor A2FM is designed to be used in open and closed circuits.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the axial piston unit. Take appropriate safety measures (e. g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to ISO 13849.
- The following tightening torques apply:
 - Fittings:
 - Observe the manufacturer's instructions regarding tightening torques of the fittings used.
 - Mounting bolts:
 - For mounting bolts with metric ISO thread according to DIN 13 or with thread according to ASME B1.1, we recommend checking the tightening torque in individual cases in accordance with VDI 2230.
 - Female threads in the axial piston unit:
 - The maximum permissible tightening torques $M_{G \max}$ are maximum values for the female threads and must not be exceeded. For values, see the following table.
 - Threaded plugs:
 - For the metallic threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs M_V apply. For values, see the following table.

Ports		Maximum permissible tightening torque of the female threads $M_{G \max}$	Required tightening torque of the threaded plugs $M_V^{1)}$	WAF hexagon socket of the threaded plugs
Standard	Size of thread			
DIN 3852 ¹⁾	M10 x 1	30 Nm	15 Nm ²⁾	5 mm
	M12 x 1.5	50 Nm	25 Nm ²⁾	6 mm
	M14 x 1.5	80 Nm	35 Nm	6 mm
	M16 x 1.5	100 Nm	50 Nm	8 mm
	M18 x 1.5	140 Nm	60 Nm	8 mm
	M20 x 1.5	170 Nm	80 Nm	10 mm
	M22 x 1.5	210 Nm	80 Nm	10 mm
	M26 x 1.5	230 Nm	120 Nm	12 mm
	M27 x 2	330 Nm	135 Nm	12 mm
	M30 x 2	420 Nm	215 Nm	17 mm
	M33 x 2	540 Nm	225 Nm	17 mm
	M42 x 2	720 Nm	360 Nm	22 mm
DIN ISO 228	G 1/4	40 Nm	-	-

1) The tightening torques apply for screws in the "dry" state as received on delivery and in the "lightly oiled" state for installation.

2) In the "lightly oiled" state, the M_V is reduced to 10 Nm for M10 x 1 and 17 Nm for M12 x 1.5.

Fixed Plug-In Motor A2FE

Features

- Fixed plug-in motor with axial tapered piston rotary group of bent-axis design, for hydrostatic drives in open and closed circuits
- Far-reaching integration in mechanical gearbox due to recessed mounting flange located in the center of the case (extremely space-saving construction)
- The output speed is dependent on the flow of the pump and the displacement of the motor
- The output torque increases with the pressure differential between the high-pressure and the low-pressure side.
- Small dimensions
- High total efficiency
- Complete unit, ready-assembled and tested
- Easy to install, simply plug into the mechanical gearbox
- No configuration specifications to be observed when installing

Technical data

Hydraulic fluid

Before starting project planning, please refer to our data sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable hydraulic fluids) and RE 90222 (HFD hydraulic fluids) and RE 90223 (HFA, HFB, HFC hydraulic fluids) for detailed information regarding the choice of hydraulic fluid and application conditions.

The plug-in motor A2FE is not suitable for operation with HFA hydraulic fluid. If HFB, HFC or HFD or environmentally acceptable hydraulic fluids are used, the limitations regarding technical data or other seals must be observed.

Selection diagram

Details regarding the choice of hydraulic fluid

The correct choice of hydraulic fluid requires knowledge of the operating temperature in relation to the ambient temperature: in a closed circuit, the circuit temperature, in an open circuit, the reservoir temperature.

The hydraulic fluid should be chosen so that the operating viscosity in the operating temperature range is within the optimum range (v_{opt}), see shaded area of the selection diagram. We recommended that the higher viscosity class be selected in each case.

Example: At an ambient temperature of X °C, an operating temperature of 60 °C is set in the circuit. In the optimum operating viscosity range (v_{opt} , shaded area) this corresponds to the viscosity classes VG 46 or VG 68; to be selected: VG 68.

Note

The case drain temperature, which is affected by pressure and speed, can be higher than the circuit temperature or reservoir temperature. At no point of the component may the temperature be higher than 115 °C. The temperature difference specified below is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend the use of a flushing and boost pressure valve (see page 14).

Viscosity and temperature of hydraulic fluid

	Viscosity [mm ² /s]	Temperature	Comment
Transport and storage at ambient temperature		$T_{min} \geq -50^\circ\text{C}$ $T_{opt} = +5^\circ\text{C}$ to $+20^\circ\text{C}$	factory preservation: up to 12 months with standard, up to 24 months with long-term
(Cold) start-up ¹⁾	$\nu_{max} = 1600$	$T_{St} \geq -40^\circ\text{C}$	$t \leq 3$ min, without load ($p \leq 50$ bar), $n \leq 1000$ rpm (for sizes 28 to 180) $n \leq 0.25 \cdot n_{nom}$ (for sizes 250 and 355)
Permissible temperature difference		$\Delta T \leq 25$ K	between axial piston unit and hydraulic fluid
Warm-up phase	$\nu < 1600$ to 400	$T = -40^\circ\text{C}$ to -25°C	at $p \leq 0.7 \cdot p_{nom}$, $n \leq 0.5 \cdot n_{nom}$ and $t \leq 15$ min
Operating phase			
Temperature difference		$\Delta T = \text{approx. } 12$ K	between hydraulic fluid in the bearing and at port T.
Maximum temperature		115 °C	in the bearing
		103 °C	measured at port T
Continuous operation	$\nu = 400$ to 10 $\nu_{opt} = 36$ to 16	$T = -25^\circ\text{C}$ to $+90^\circ\text{C}$	measured at port T, no restriction within the permissible data
Short-term operation ²⁾	$\nu_{min} \geq 7$	$T_{max} = +103^\circ\text{C}$	measured at port T, $t < 3$ min, $p < 0.3 \cdot p_{nom}$
FKM shaft seal ¹⁾		$T \leq +115^\circ\text{C}$	see page 5

1) At temperatures below -25°C , an NBR shaft seal is required (permissible temperature range: -40°C to $+90^\circ\text{C}$).

2) Sizes 250 and 355, please contact us.

Technical data

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

To ensure the functional reliability of the axial piston unit, a gravimetric analysis of the hydraulic fluid is necessary to determine the amount of solid contaminant and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 is to be maintained.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

If the above classes cannot be achieved, please contact us.

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the speed of the axial piston unit and the case drain pressure (case pressure). The mean differential pressure of 2 bar between the case and the ambient pressure may not be enduringly exceeded at normal operating temperature. For a higher differential pressure at reduced speed, see diagram. Momentary pressure spikes ($t < 0.1$ s) of up to 10 bar are permitted. The service life of the shaft seal decreases with an increase in the frequency of pressure spikes.

The case pressure must be equal to or higher than the ambient pressure.

The values are valid for an ambient pressure $p_{abs} = 1$ bar.

Temperature range

The FKM shaft seal may be used for case drain temperatures from -25 °C to +115 °C.

Note

For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C). State NBR shaft seal in plain text when ordering. Please contact us.

Direction of flow

Direction of rotation, viewed on drive shaft

clockwise	counter-clockwise
A to B	B to A

Speed range

No limit to minimum speed n_{min} . If uniformity of motion is required, speed n_{min} must not be less than 50 rpm. See table of values on page 7 for maximum speed.

Long-life bearing

Sizes 250 and 355

For long service life and use with HF hydraulic fluids. Identical external dimensions as motor with standard bearings. Subsequent conversion to long-life bearings is possible.

Technical data

Operating pressure range

(operating with mineral oil)

Pressure at service line port A or B

Sizes 28 to 180

Nominal pressure p_{nom} _____ 400 bar absolute

Maximum pressure p_{max} _____ 450 bar absolute

Single operating period _____ 10 s

Total operating period _____ 300 h

Total operating period _____ 300 h

Summation pressure (pressure A + pressure B) p_{Su} 700 bar

Minimum pressure (high-pressure side) _____ 25 bar absolute

Rate of pressure change $R_{A\ max}$

with integrated pressure-relief valve _____ 9000 bar/s

without pressure-relief valve _____ 16000 bar/s

Note

Values for other hydraulic fluids, please contact us.

Minimum pressure – pump mode (inlet)

To prevent damage to the axial piston motor in pump operating mode (change of high-pressure side with unchanged direction of rotation, e. g. when braking), a minimum pressure must be guaranteed at the service line port (inlet). The minimum pressure depends on the speed of the axial piston unit (see characteristic curve below).

This diagram is valid only for the optimum viscosity range from $v_{opt} = 36$ to $16\text{ mm}^2/\text{s}$.

Please contact us if these conditions cannot be satisfied.

Definition

Nominal pressure p_{nom}

The nominal pressure corresponds to the maximum design pressure.

Maximum pressure p_{max}

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

Minimum pressure (high-pressure side)

Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

Summation pressure p_{Su}

The summation pressure is the sum of the pressures at both service line ports (A and B).

Rate of pressure change R_A

Maximum permissible rate of pressure rise and reduction during a pressure change over the entire pressure range.

Total operating period = $t_1 + t_2 + \dots + t_n$

Mass (approx.)	m	kg	25	34	36	47	48	82	110

1) The values are valid:

- for the optimum viscosity range from $\nu_{opt} = 36$ to 16 mm²/s
- with hydraulic fluid based on mineral oils

2) Intermittent maximum speed: overspeed for unload and overhauling processes, $t < 5$ s and $\Delta p < 150$ bar

3) Restriction of input flow with counterbalance valve, see page 19

4) Torque without radial force, with radial force see page 8

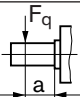

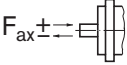

Note

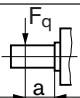

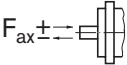

Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, with respect to speed variation, reduced angular acceleration as a function of the frequency and the permissible start up angular acceleration (lower than the maximum angular acceleration) can be found in data sheet RE 90261.

- 1) With intermittent operation
- 2) Maximum permissible axial force during standstill or when the axial piston unit is operating in non-pressurized condition.
- 3) Please contact us.
- 4) Restricted technical data only for splined shaft
- 5) When at a standstill or when axial piston unit operating in non-pressurized conditions. Higher forces are permissible when under pressure, please contact us.

Note

Influence of the direction of the permissible axial force:

$+F_{\text{ax max}}$ = Increase in service life of bearings

$-F_{\text{ax max}}$ = Reduction in service life of bearings (avoid)

Technical data

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

	Toothed gear drive	V-belt output
NG	φ_{opt}	φ_{opt}
28 to 180	$\pm 70^\circ$	$\pm 45^\circ$
250 and 355	$\pm 45^\circ$	$\pm 70^\circ$

Determining the operating characteristics

Input flow $q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v}$ [L/min]

Speed $n = \frac{q_v \cdot 1000 \cdot \eta_v}{V_g}$ [min⁻¹]

Torque $T = \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi}$ [Nm]

Power $P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600}$ [kW]

V_g = Displacement per revolution in cm³

Δp = Differential pressure in bar

n = Speed in rpm

η_v = Volumetric efficiency

η_{mh} = Mechanical-hydraulic efficiency

η_t = Total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

Dimensions sizes 28 to 180

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Flushing and boost pressure valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

The flushing and boost pressure valve is used to remove heat from the hydraulic circuit.

In an open circuit, it is used only for flushing the housing.

In a closed circuit, it ensures a minimum boost pressure level in addition to the case flushing.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the case drain fluid. The hydraulic fluid, removed out of the closed circuit must be replaced by cooled hydraulic fluid from the boost pump.

With port plate 027 (sizes 45 to 180 and 250) and with port plate 107 (size 355), the valve is mounted directly on the fixed motor.

Cracking pressure of pressure retaining valve

(observe when setting the primary valve)

Sizes 45 to 355, fixed setting _____ 16 bar

Switching pressure of flushing piston Δp

Sizes 45 to 355 _____ 8 ± 1 bar

Flushing flow q_v

Orifice (throttles with integrated valve) can be used to set the flushing flows as required.

Following parameters are based on:

$$\Delta p_{ND} = p_{ND} - p_G = 25 \text{ bar and } v = 10 \text{ mm}^2/\text{s}$$

(p_{ND} = low pressure, p_G = case pressure)

Schematic

Standard flushing flows

Flushing and boost pressure valve, mounted (code 7)

Size	Flushing flow q_v [L/min]	ϕ [mm]	Mat. No. of orifice
45	3.5	1.2	R909651766
107, 125	8	1.8	R909419696
160, 180	10	2.0	R909419697
250	10	2.0	R909419697
355	16	2.5	R910803019

With sizes 45 to 180, orifices can be supplied for flushing flows from 3.5 to 10 L/min. For other flushing flows, please state the required flushing flow when ordering. The flushing flow without orifice is approx. 12 to 14 L at low pressure $\Delta p_{ND} = 25$ bar.

Flushing and boost pressure valve, integrated (code 9)

Pressure-relief valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

The MHDB pressure-relief valves (see RE 64642) protect the hydraulic motor from overload. As soon as the set cracking pressure is reached, the hydraulic fluid flows from the high-pressure side to the low-pressure side.

The pressure-relief valves are only available in combination with port plates 181, 191 or 192 (counterbalance valve for mounting to port plate 181: see next page).

Cracking pressure setting range _____ 50 to 420 bar

With the version "with pressure boost facility" (192), a higher pressure setting can be realized by applying an external pilot pressure of 25 to 30 bar to port P_{St}.

When ordering, please state in plain text:

- Cracking pressure of pressure-relief valve
- Cracking pressure with pilot pressure applied to P_{St} (only with version 192)

Version without pressure boost facility "191"

Version with pressure boost facility "192"

Pressure-relief valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

1) Observe the general instructions on page 24 for the maximum tightening torques.

2) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

3) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

Counterbalance valve BVD and BVE

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Function

Travel drive/winch counterbalance valves are designed to reduce the danger of overspeeding and cavitation of axial piston motors in open circuits. Cavitation occurs if the motor speed is greater than it should be for the given input flow while braking, travelling downhill, or lowering a load.

If the inlet pressure drops, the counterbalance spool throttles the return flow and brakes the motor until the inlet pressure returns to approx. 20 bar.

Note

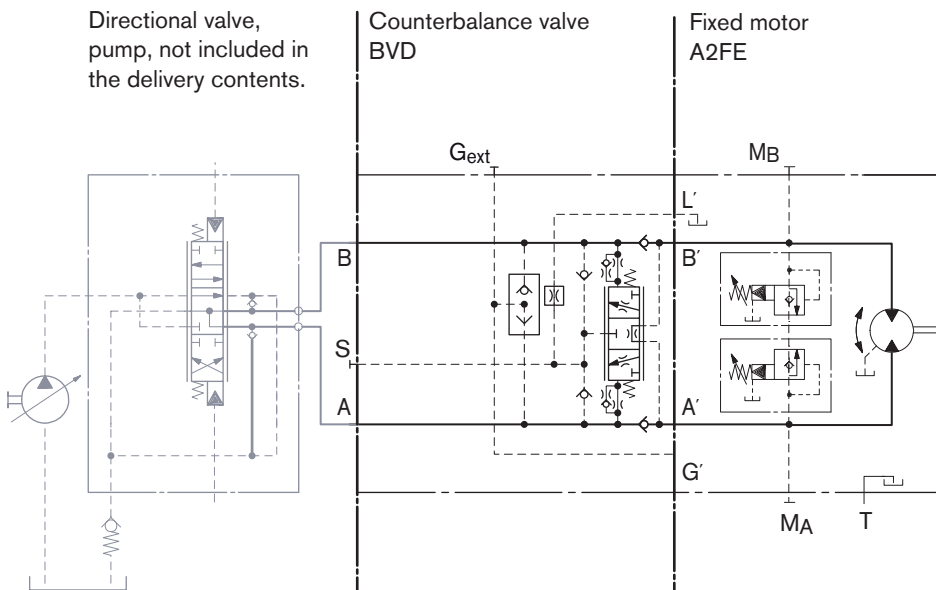

- BVD available for sizes 28 to 180 and BVE available for sizes 107 to 180.
- The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set. Ordering example: A2FE90/61W-VAB188 + BVD20F27S/41B-V03K16D0400S12
- The counterbalance valve does not replace the mechanical service brake and park brake.
- Observe the detailed notes on the BVD counterbalance valve in RE 95522 and BVE counterbalance valve in RE 95525!
- For the design of the brake release valve, we must know for the mechanical park brake:
 - the pressure at the start of opening
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

Travel drive counterbalance valve BVD...F

Application option

- Travel drive on wheeled excavators

Example schematic for travel drive on wheeled excavators A2FE090/61W-VAB188 + BVD20F27S/41B-V03K16D0400S12

Counterbalance valve BVD and BVE

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

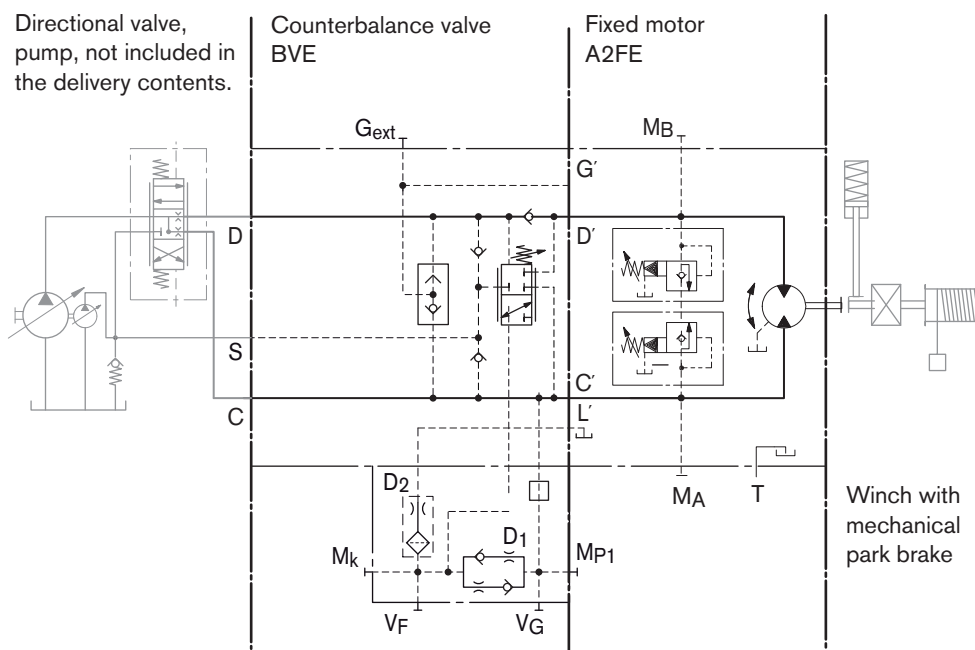

Winch counterbalance valve BVD...W and BVE

Application options

- Winch drive in cranes (BVD and BVE)
- Track drive in excavator crawlers (BVD)

Example schematic for winch drive in cranes

1) Observe the general instructions on page 24 for the maximum tightening torques.

2) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

3) The spot face can be deeper than specified in the appropriate standard.

4) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

Counterbalance valve BVD and BVE

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Mounting the counterbalance valve

When delivered, the counterbalance valve is mounted to the motor with two tacking screws (transport protection). The tacking screws may not be removed while mounting the service lines. If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be mounted to the motor port plate using the provided tacking screws. The counterbalance valve is finally mounted to the motor by screwing on the SAE flange with the following screws:

6 screws (1, 2, 3, 4, 5, 8) _____ length $B1+B2+B3$
 2 screws (6, 7) _____ length $B3+B4$

Tighten the screws in two steps in the specified sequence from 1 to 8 (see following scheme).

In the first step, the screws must be tightened with half the tightening torque, and in the second step with the maximum tightening torque (see following table).

Thread	Strength class	Tightening torque [Nm]
M6 x 1 (tacking screw)	10.9	15.5
M10	10.9	75
M12	10.9	130
M14	10.9	205

1) Minimum required thread reach $1 \times \varnothing$ -thread

2) Including sandwich plate

Speed sensors

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

The versions A2FE...U and A2FE...F ("prepared for speed sensor", i.e. without sensor) is equipped with a toothed ring.

On deliveries "prepared for speed sensor", the port is plugged with a pressure-resistant cover.

With the DSA or HDD speed sensor mounted a signal proportional to motor speed can be generated. The sensors measures the speed and direction of rotation.

Ordering code, technical data, dimensions and details on the connector, plus safety information about the sensor can be found in the relevant data sheet.

DSA _____ RE 95133

HDD _____ RE 95135

The sensor is mounted on the port provided for this purpose with a mounting bolt.

We recommend ordering the A2FE plug-in motor complete with sensor mounted.

Version "V"

Sizes 28 to 180 with DSA sensor

Size 250 with DSA sensor on request.

Version "H"

Size 250 with HDD sensor

Installation instructions

General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

The case drain fluid in the motor housing must be directed to the reservoir via the highest available drain port (T_1 , T_2).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the minimum permissible case pressure of all connected units is not exceeded in any situation. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Installation position

See the following examples 1 to 5.

Further installation positions are possible upon request.

Recommended installation positions: 1 and 2.

Installation position	Air bleed	Filling
1	–	T_1
2	–	T_1 (sizes 28 to 180) T_2 (sizes 250 and 355)
3	–	T_1
4	(L_1)	T_1 , (L_1)
5	(L_1)	T_2 , (L_1)
6	(L_1)	T_1 , (L_1)

L_1 Filling / air bleed

T_1 , T_2 Drain port

$h_{t\ min}$ Minimum required immersion depth (200 mm)

$h_{\ min}$ Minimum required spacing to reservoir bottom (100 mm)

- Standard for sizes 250 and 355, special version for sizes 28 to 180
- Piping suggestion without port T_2 (standard for sizes 28 to 180).
- Piping suggestion with port T_2 (standard for sizes 250 to 355, special version for sizes 28 to 180).
- Installation position only permissible if port T_2 is fitted (standard for sizes 250 and 355, special version for sizes 28 to 180).

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

General instructions

- The motor A2FE is designed to be used in open and closed circuits.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the axial piston unit. Take appropriate safety measures (e. g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to ISO 13849.
- The following tightening torques apply:
 - Fittings:
 - Observe the manufacturer's instructions regarding tightening torques of the fittings used.
 - Mounting bolts:
 - For mounting bolts with metric ISO thread according to DIN 13 or with thread according to ASME B1.1, we recommend checking the tightening torque in individual cases in accordance with VDI 2230.
 - Female threads in the axial piston unit:
 - The maximum permissible tightening torques $M_{G \max}$ are maximum values for the female threads and must not be exceeded. For values, see the following table.
 - Threaded plugs:
 - For the metallic threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs M_V apply. For values, see the following table.

Ports		Maximum permissible tightening torque of the female threads $M_{G \max}$	Required tightening torque of the threaded plugs M_V ¹⁾	WAF hexagon socket of the threaded plugs
Standard	Size of thread			
DIN 3852	M12 x 1.5	50 Nm	25 Nm ²⁾	6 mm
	M16 x 1.5	100 Nm	50 Nm	8 mm
	M18 x 1.5	140 Nm	60 Nm	8 mm
	M20 x 1.5	170 Nm	80 Nm	10 mm
	M22 x 1.5	210 Nm	80 Nm	10 mm
	M26 x 1.5	230 Nm	120 Nm	12 mm
	M27 x 2	330 Nm	135 Nm	12 mm
	M30 x 2	420 Nm	215 Nm	17 mm
	M33 x 2	540 Nm	225 Nm	17 mm
DIN ISO 228	G 1/4	40 Nm	-	-

1) The tightening torques apply for screws in the "dry" state as received on delivery and in the "lightly oiled" state for installation.

2) In the "lightly oiled" state, the M_V is reduced to 17 Nm for M12 x 1.5.

Axial piston fixed motor

A2FM Series 70

A2FE Series 70

RE 91071

Edition: 12.2015

Replaces 03.2015

- ▶ A2FMN, A2FEN (sizes 56 to 107):
Nominal pressure 300 bar
Maximum pressure 350 bar
- ▶ A2FMM, A2FEM (sizes 45 to 90):
Nominal pressure 400 bar
Maximum pressure 450 bar
- ▶ A2FMH, A2FEH (sizes 45 to 90):
Nominal pressure 450 bar
Maximum pressure 500 bar

Features

- ▶ Fixed motor with axial tapered piston rotary group of bent-axis design, for hydrostatic drives in open and closed circuits
- ▶ For use in mobile and stationary applications
- ▶ Far-reaching integration of the plug-in version in mechanical gears due to recessed mounting flange located in the center of the case (extremely space-saving construction)
- ▶ Easy to install, simply plug the plug-in version into the mechanical gearbox
- ▶ The output speed is dependent on the flow of the pump and the displacement of the motor.
- ▶ The output torque increases with the pressure differential between the high-pressure side and the low-pressure side.
- ▶ Finely graduated sizes permit far-reaching adaptation to the drive concerned
- ▶ High power density
- ▶ Small dimensions
- ▶ High total efficiency
- ▶ Good starting efficiency
- ▶ Integrated flushing valve option

⁴⁾ Type code version "L" not available in combination with A2FMH/A2FEH since in the case of pressure range "H" the long-life bearing is already included in the standard version (type code designation "0").

Hydraulic fluids

The fixed motor A2FM/A2FE is designed for operation with HLP mineral oil according to DIN 51524.

Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)
- ▶ 90223: Fire-resistant, water-containing hydraulic fluids (HFAE, HFAS, HFB, HFC)

Details regarding the selection of hydraulic fluid

The hydraulic fluid should be selected so that the operating viscosity in the operating temperature range is within the optimum range (v_{opt} , see selection diagram).

Note

At no point on the component may the temperature be higher than 115 °C. The temperature difference specified in the table is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend the use of a flushing and boost pressure valve (see page 19).

Viscosity and temperature of hydraulic fluids

	Viscosity	Temperature	Comment
Cold start	$v_{max} \leq 1600 \text{ mm}^2/\text{s}$	$\theta_{St} \geq -40 \text{ °C}$	$t \leq 3 \text{ min}$, $n \leq 1000 \text{ rpm}$, without load $p \leq 50 \text{ bar}$
Permissible temperature difference		$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid in the system
Warm-up phase	$v < 1600 \text{ to } 400 \text{ mm}^2/\text{s}$	$\theta = -40 \text{ °C to } -25 \text{ °C}$	at $p \leq 0.7 \times p_{nom}$, $n \leq 0.5 \times n_{nom}$ and $t \leq 15 \text{ min}$
Continuous operation	$v = 400 \text{ to } 10 \text{ mm}^2/\text{s}$		this corresponds, for VG 46 for example, to a temperature range of +5 °C to +85 °C (see selection diagram)
		$\theta = -25 \text{ °C to } +103 \text{ °C}$	measured at port T note the permissible temperature range of the shaft seal ($\Delta T = \text{approx. } 12 \text{ K}$ between bearing/shaft seal and port T)
	$v_{opt} = 36 \text{ to } 16 \text{ mm}^2/\text{s}$		range of optimum operating viscosity and efficiency
Short-term operation	$v_{min} \geq 7 \text{ mm}^2/\text{s}$		$t < 3 \text{ min}$, $p < 0.3 \times p_{nom}$

▼ Selection diagram

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit. A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At very high hydraulic fluid temperatures (90 °C to maximum 103 °C, measured at port **T**), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

Flow direction

Direction of rotation, viewed on drive shaft	
clockwise	counter clockwise
A to B	B to A

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the speed of the axial piston unit and the leakage pressure in the housing (case pressure). The mean differential pressure of 2 bar between the housing and the ambient pressure may not be enduringly exceeded at normal operating temperature. Momentary pressure peaks ($t < 0.1$ s) up to 10 bar are allowed. The service life of the shaft seal decreases with increasing frequency of pressure spikes and increasing mean differential pressure.

The case pressure must be equal to or higher than the ambient pressure.

The FKM shaft seal ring may be used for leakage temperatures from -25 °C to +115 °C. For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

Working pressure range

Pressure at working port A or B		Definition
Nominal pressure p_{nom}	A2FMN, A2FEN	300 bar absolute
	A2FMM, A2FEM	400 bar absolute
	A2FMH, A2FEH	450 bar absolute
Maximum pressure p_{max}	A2FMN, A2FEN	350 bar absolute
	A2FMM, A2FEM	450 bar absolute
	A2FMH, A2FEH	500 bar absolute
Single operating period		10 s
Total operating period		300 h
Minimum pressure (high-pressure side)	25 bar absolute	Minimum pressure at the high-pressure side (A or B) required to prevent damage to the axial piston unit.
Minimum pressure – pump operating mode (inlet)	see characteristic	To prevent damage to the axial piston motor in pump mode (change of high-pressure side with unchanged direction of rotation, e.g. when braking), a minimum pressure must be guaranteed at the working port (inlet). The minimum pressure depends on the rotational speed and displacement of the axial piston unit.
Total pressure p_{Su} (pressure A + pressure B)	700 bar absolute	The summation pressure is the sum of the pressures at both work ports (A and B).
Rate of pressure change $R_{A\ max}$		Maximum permissible rate of pressure build-up and reduction during a pressure change across the entire pressure range.
with built-in pressure relief valve	9000 bar/s	
without pressure relief valve	16000 bar/s	

▼ Rate of pressure change $R_{A\ max}$

▼ Minimum pressure – pump operating mode (inlet)

▼ Pressure definition

This diagram is only valid for the optimum viscosity range of $\nu_{opt} = 36$ to $16\text{ mm}^2/\text{s}$.

Please contact us if these conditions cannot be satisfied.

Note

Working pressure range valid when using hydraulic fluids based on mineral oils. Values for other hydraulic fluids – please contact us.

Total operating period = $t_1 + t_2 + \dots + t_n$

Speed range

No limit to minimum speed n_{min} . If uniformity of motion is required, speed n_{min} must not be less than 50 rpm.

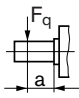

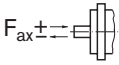

1) The valid values (observing the maximum permissible flow):
 – to the optimum viscosity range from $\nu_{opt} = 36$ to 16 mm²/s
 – with hydraulic fluid based on mineral oil

2) Intermittent maximum speed: Overspeed for unload and overhauling processes, $t < 5$ s and $\Delta p < 150$ bar

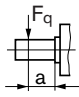

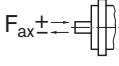

3) Torque without radial force, with radial force see page 8

Rotational speed	n	$= \frac{q_v \times 1000 \times \eta_v}{V_g}$	[rpm]
Torque	T	$= \frac{V_g \times \Delta p \times \eta_{mh}}{20 \times \pi}$	[Nm]
Power	P	$= \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p \times \eta_t}{600}$	[kW]
Key	V_g	$=$	Displacement per revolution [cm ³]
	Δp	$=$	Differential pressure [bar]
	n	$=$	Rotational speed [rpm]
	η_v	$=$	Volumetric efficiency
	η_{mh}	$=$	Mechanical-hydraulic efficiency
	η_t	$=$	Total efficiency ($\eta_t = \eta_v \times \eta_{mh}$)

- Notes**
- ▶ Theoretical values, without efficiency and tolerances; values rounded.
 - ▶ Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, such as speed variation, reduced angular acceleration as a function of the frequency and the permissible angular acceleration at start (lower than the maximum angular acceleration) can be found in data sheet 90261.
 - ▶ The permissible axial force in direction $-F_{ax}$ is to be avoided as the lifetime of the bearing is reduced.
 - ▶ Special requirements apply in the case of belt drives. Please contact us.

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

▼ **Gear output drive**

- 1 “Counter-clockwise” rotation Pressure at port **B**
- 2 “Clockwise” rotation Pressure at port **A**
- 3 “Alternating” direction of rotation

Flushing and boost-pressure valve, integrated

The flushing and boost-pressure valve is used to remove heat from the hydraulic circuit. In a closed circuit, it is used for case flushing and safeguarding the minimum boost pressure. Hydraulic fluid is directed from the respective low pressure side into the motor case. This is then fed into the reservoir, together with the leakage. The hydraulic fluid removed from the closed circuit must be replaced by cooled hydraulic fluid from the boost pump.

Circuit diagram

1) Center bore according to DIN 332 (thread according to DIN 13)
 2) For notes on tightening torques, see instruction manual.

Cracking pressure of pressure retaining valve

(observe when setting the primary valve)
 ► Sizes 45 to 107(N), fixed setting 16 bar

Switching pressure of flushing spool

► Sizes 45 to 107(N) $\Delta p = 8 \pm 1$ bar

Flushing flow

Orifices can be used to adjust the flushing flows as required. The following information is based on:
 $\Delta p_{ND} = p_{ND} - p_G = 25$ bar and $v = 10$ mm²/s
 (p_{ND} = low pressure, p_G = case pressure)

Size	Throttle \varnothing [mm]	Flushing flow q_v [l/min]
45, 56, 63, 80, 90, 107(N)	1.0	2.6
	1.5	6
	1.7	7.4
	1.8	8.5
	2.3	11.4
	3	12.5

Speed sensors DSA and DSM

The versions A2F...A and A2F...N (“prepared for speed sensor”, i.e. without sensor) is equipped with splines on the rotary group.

A signal proportional to motor speed can be generated with the fitted DSA/DSM speed sensor. The DSA/DSM sensor registers the speed and direction of rotation.

Type code, technical data, dimensions and details on the connector, plus safety instructions about the sensor can be found in the relevant data sheet 95133 – DSA and 95132 – DSM.

The sensor is mounted on the port provided for this purpose with a mounting bolt. On deliveries without sensor, the port is plugged with a pressure-resistant cover. We recommend ordering the A2F fixed motor complete with mounted sensor.

Installation instructions

General

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit may empty via the hydraulic lines.

Particularly in the installation position “drive shaft upwards”, filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The leakage in the housing area must be directed to the reservoir via the highest drain port (**T₁**, **T₂**).

If a shared drain line is used for several units, make sure that the respective case pressure is not exceeded. The shared drain line must be dimensioned to ensure that the maximum permissible case pressure of all connected units is not exceeded in any operational circumstances, particularly at cold start. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Note

- ▶ For A2FM with installation position “shaft upwards” an air bleed port **R** is required (specify in plain text when ordering, special version).
- ▶ For A2FE the “shaft upwards” installation position is not permissible.

Key	
F	Filling / air bleeding Note: F is part of the external piping
R	Air bleed port (special version)
T₁, T₂	Drain port
h_{t min}	Minimum required immersion depth (200 mm)
h_{min}	Minimum required distance to reservoir base (100 mm)

Installation position

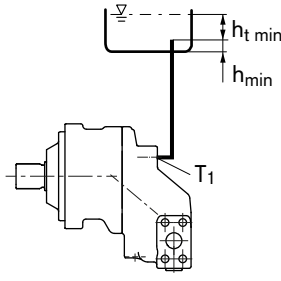

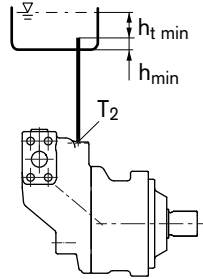

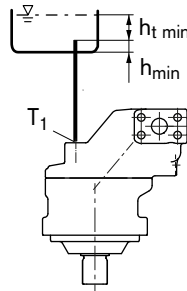

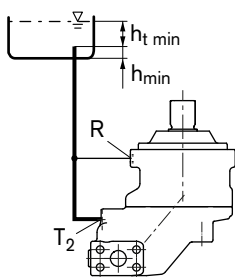

See the following examples **1** to **8**.

Additional installation positions are possible upon request.

Recommended installation position: **1** and **2**

Below-reservoir installation (standard)

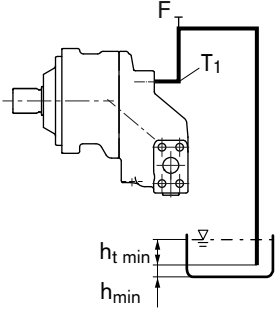

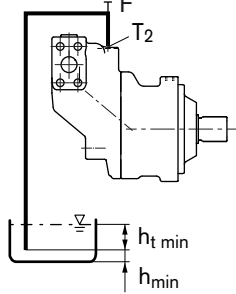

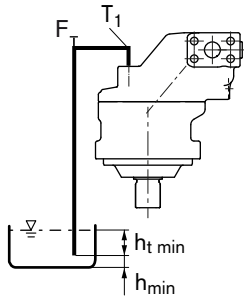

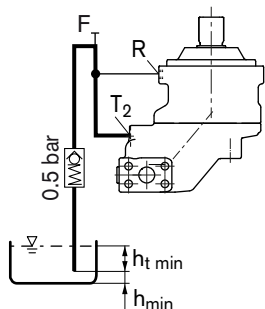

Below-reservoir installation is when the axial piston unit is installed outside of the reservoir and below the minimum fluid level.

Installation position	Air bleeding	Filling
1 	-	T₁
2 	-	T₂
3 	-	T₁
4 	R	T₂

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir. Recommendation for installation position **8** (drive shaft upward): A check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the housing area.

Note
Port **F** is part of the external piping and must be provided by the customer to make filling and air bleeding easier.

Installation position	Air bleeding	Filling
<p>5</p> 	F	T₁ (F)
<p>6</p> 	F	T₂ (F)
<p>7</p> 	F	T₁ (F)
<p>8</p> 	R	T₂ (F)

Project planning notes

- ▶ The motor A2FM/A2FE is designed to be used in open and closed circuits.
- ▶ The project planning, installation and commissioning of the axial piston unit require the involvement of qualified skilled personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, request it from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes must be observed.
- ▶ Depending on the operating state of the axial piston unit (working pressure, fluid temperature), the characteristic may shift.
- ▶ Not all variants of the product are approved for use in safety functions according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
- ▶ Working ports:
 - The ports and fixing threads are designed for the specified peak pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified operating conditions (pressure, volume flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports can only be used to accommodate hydraulic lines.
- ▶ Preservation: Our axial piston units are supplied as standard with protection to preserve them for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or the instruction manual.

Safety instructions

- ▶ During and shortly after operation, there is a risk of burns on the axial piston unit. Take appropriate safety measures (e.g. by wearing protective clothing).

Fluid

We request that before starting a project detailed information about the choice of pressure fluids and application conditions are taken from our catalogue sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable hydraulic fluids) and RE 90223 (fire resistance fluids, HF).

When using HF- or environmentally acceptable hydraulic fluids possible limitations for the technical data have to be taken into consideration. If necessary please consult our technical department (please indicate type of the hydraulic fluid used for your application on the order sheet).

The sizes 22..56 are not suitable for operation with HFA, HFB and HFC.

Operation viscosity range

In order to obtain optimum efficiency and service life, we recommend that the operating viscosity (at operating temperature) be selected from within the range:

$$v_{opt} = \text{operating viscosity } 16...36 \text{ mm}^2/\text{s}$$

referred to the loop temperature (closed circuit) or tank temperature (open circuit).

Viscosity limits

The limiting values for viscosity are as follows:

Size 22...56

$v_{min} = 5 \text{ mm}^2/\text{s}$, short term at a max. permissible temp. of $t_{max} = 115^\circ\text{C}$

$v_{max} = 1600 \text{ mm}^2/\text{s}$, short term on cold start ($t_{min} = -40^\circ\text{C}$)

Size 71...500

$v_{min} = 10 \text{ mm}^2/\text{s}$, short term at a max. permissible drain temp. $t_{max} = 90^\circ\text{C}$

$v_{max} = 1000 \text{ mm}^2/\text{s}$, short term on cold start ($t_{min} = -25^\circ\text{C}$)

Please note that the max. fluid temperature is also not exceeded in certain areas (for instance bearing area).

At temperature of -25°C up to -40°C special measures may be required for certain installation positions, please contact us.

Selection diagram

Notes on the selection of the hydraulic fluid

In order to select the correct fluid, it is necessary to know the operating temperature in the loop (closed circuit) or the tank temperature (open circuit) in relation to the ambient temperature.

The hydraulic fluid should be selected so that within the operating temperature range, the operating viscosity lies within the optimum range (v_{opt}) (see shaded section of the selection diagram). We recommend that the highest possible viscosity range should be chosen in each case.

Example: At an ambient temperature of $X^\circ\text{C}$ the operating temperature is 60°C . Within the operating viscosity range (v_{opt} ; shaded area), this corresponds to viscosity ranges VG 46 or VG 68. VG 68 should be selected.

Important: The leakage oil (case drain oil) temperature is influenced by pressure and motor speed and is always higher than the circuit temperature. However, at no point in the circuit may the temperature exceed 115°C for sizes 22...56 or 90°C for sizes 71...500.

If it is not possible to comply with the above condition because of extreme operating parameters or high ambient temperatures we recommend housing flushing. Please consult us.

Filtration

The finer the filtration the better the achieved purity grade of the pressure fluid and the longer the life of the axial piston unit. To ensure the functioning of the axial piston unit a minimum purity grade of:

9 to NAS 1638

18/15 to ISO/DIS 4406 is necessary.

At very high temperatures of the hydraulic fluid (90°C to max. 115°C , not permissible for sizes 71...500) at least cleanliness class

8 to NAS 1638

17/14 to ISO/DIS 4406 is necessary.

If above mentioned grades cannot be maintained please consult supplier.

Technical Data

valid for operation with mineral oils

Flushing of the bearings (Sizes 125...500)

operating conditions, flushing quantities and notes on bearing flushing see RE 92 050 (A4VSO).

Case drain pressure

The max. permissible leakage pressure (housing pressure) is dependent on speed (see diagram). The pressure in the housing must be equal to or greater than the external pressure on the shaft sealing ring.

Max. leakage pressure (housing pressure)

$p_{abs. max.}$ _____ 6 bar (sizes 22...56)
_____ 4 bar (sizes 71...500)

A leakage line to the tank is necessary.

Installation and Commissioning Guidelines

General

At start-up and during operation the motor housing has imperatively to be filled up with hydraulic fluid (filling of the case chamber). Start-up has to be carried out at low speed and without load till the system is completely bled.

At a longer standstill the case may discharge via operating line. At new start-up a sufficient filling of the housing has to be granted.

The leakage oil in the housing has to be discharged to the tank via highest positioned case drain port.

Installation position

- Sizes 22...56: Shaft horizontal or shaft down
- Sizes 71 (series1): Shaft horizontal, vertical installation position as to agreement
- Sizes 125...500: Optional, at vertical installation position bearing flushing is recommended at port U (as to RD 9205)

Installation below tank level

Motor below min. oil level in the tank (standard)

- Fill up axial piston motor before start-up via highest positioned case drain port
- Operate motor at low speed till motor system is completely filled up
- Minimum immersion depth of the drain line in the tank: 200mm (relative to the min. oil level in the tank).

Installation on top of tank level

Motor on top of min. oil level in the tank

- Actions as installation below tank level
- Note: installation position "drive shaft up" for sizes 22...56 not permissible

Table of values (theoretical values, without considering η_{mh} and η_v ; values rounded)

Features

- Fixed displacement motor in axial piston swashplate design for hydrostatic drives in open and closed circuit operation
- The output speed is proportional to the inlet flow
- The output torque increases with the pressure differential between the high and low pressure sides
- For use in mobile and industrial applications
- Long service life
- High permissible output speeds
- Well proven A10-rotary group technology
- High power to weight ratio – compact design
- Plug-in version for space saving installation
- Low noise level
- Mechanical and hydraulic connections also acc. to SAE standards
- Speed sensor optional
- Integrated anti cavitation valve optional, i.e. for fan drives

Technical data

Fluids

Prior to project design, please see our technical data sheets RE 90220 (mineral oil) and RE 90221 (environmentally acceptable fluids) for detailed information on fluids and operating conditions.

For operation on environmentally acceptable fluids please consult us (when ordering, please state in clear text the fluid to be used).

Operating viscosity range

To achieve optimum values for efficiency and service life we recommend an operation viscosity (at operating temperature) within the range,

$$v_{\text{opt}} = \text{opt. operating viscosity } 16 \dots 36 \text{ mm}^2/\text{s}$$

referred to the tank temperature (open circuit).

Limit of viscosity range

For critical operation conditions the following values apply:

$$v_{\text{min}} = \begin{array}{l} 5 \text{ mm}^2/\text{s} \text{ (closed circuit)} \\ 10 \text{ mm}^2/\text{s} \text{ (open circuit)} \\ \text{for short periods (} t \leq 1 \text{ min)} \\ \text{at a max. perm. temperature of } 115 \text{ }^\circ\text{C.} \end{array}$$

Please note that the max. leakage fluid temperature of $115 \text{ }^\circ\text{C}$ is also not exceeded in certain areas (for instance bearing area). The fluid temperature in the bearing area is approx. 5 K higher than the average leakage fluid temperature

$$v_{\text{max}} = \begin{array}{l} 1600 \text{ mm}^2/\text{s} \\ \text{for short periods (} t \leq 1 \text{ min)} \\ \text{on cold start} \\ (t_{\text{min}} = p \leq 30 \text{ bar, } n \leq 1000 \text{ min}^{-1}, -25 \text{ }^\circ\text{C}). \end{array}$$

At temperatures between $-40 \text{ }^\circ\text{C}$ and $-25 \text{ }^\circ\text{C}$ special measures are required, please consult us for further information.

For detailed information on operation with low temperatures see data sheet RE 90300-03-B.

Selection diagram

Notes on the selection of the hydraulic fluid

In order to select the correct fluid, it is necessary to know the operating temperature in the tank (open circuit) in relation to the ambient temperature.

The fluid should be selected so that within the operating temperature range, the viscosity lies within the optimum range (v_{opt}), see shaded section of the selection diagram. We recommend to select the higher viscosity grade in each case.

Example: at an ambient temperature of $X \text{ }^\circ\text{C}$ the operating temperature in the tank is $60 \text{ }^\circ\text{C}$. In the optimum viscosity range (v_{opt} , shaded area) this corresponds to viscosity grades VG 46 resp. VG 68; VG 68 should be selected.

Important: The leakage oil (case drain oil) temperature is influenced by pressure and input speed and is always higher than the tank temperature. However, at no point of the component may the temperature exceed $115 \text{ }^\circ\text{C}$.

If it is not possible to comply with the above conditions because of extreme operating parameters please consult us.

Filtration of the hydraulic fluid

Filtration improves the cleanliness level of the hydraulic fluid, which, in turn, increases the service life of the axial piston unit.

To ensure the functional reliability of the axial piston unit, a gravimetric evaluation is necessary for the hydraulic fluid to determine the amount of contamination by solid matter and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 to ISO 4406 is to be maintained.

If above requirements cannot be maintained please consult us.

Technical data

Operating pressure range

Pressure at service line port (pressure port) A or B

Nominal pressure p_{nom} _____ 280 bar absolute

Maximum pressure p_{max} _____ 350 bar absolute

Single operating period _____ 2,5 ms

Total operating period _____ 300 h

Minimum pressure (high pressure side) _____ 10 bar²⁾

Rate of pressure change $R_{A\ max}$ _____ 16000 bar/s

Outlet pressure

at n_{max}

Minimum pressure at low pressure side $p_{abs\ max}$ _____ 18 bar

Case drain pressure

Maximum permissible case drain pressure (at port L, L₁):

$P_{max\ abs}$ motor operation in open circuit _____ 4 bar_{abs}

$P_{max\ abs}$ motor operation in closed circuit _____ 4 bar_{abs}

$P_{max\ abs}$ pump/motor operation in open circuit _____ 2 bar_{abs}

Direction of flow

viewed on drive shaft	
clockwise rotation	counter clockwise rotation
A to B	B to A

Definitions

Nominal pressure p_{nom}

The nominal pressure corresponds to the maximum design pressure.

Maximum pressure p_{max}

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

Minimum pressure (high-pressure side)

Minimum pressure at the high pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

Rate of pressure change R_A

Maximum permissible rate of pressure rise and pressure reduction during a pressure change, over the entire pressure range.

Total operating period = $t_1 + t_2 + \dots + t_n$

1) Other values on request

2) Lower pressures time dependent, please consult us.

¹⁾ for maximum speed an outlet pressure (in low pressure side) of 18 bar is required (see diagram on page 7)

Note

Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. We recommend testing the loads by means of experiment or calculation / simulation and comparison with the permissible values.

Technical data

Permissible motor speed in relation to outlet pressure

Determination of motor size (NG)

Input flow $q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v}$ [L/min] $V_g =$ Displacement per revolution in cm^3

Torque $T = \frac{1,59 \cdot V_g \cdot \Delta p \cdot \eta_{mh}}{100}$ [Nm] $\Delta p =$ Differential pressure in bar

or $T = T_k \cdot \Delta p \cdot \eta_{mh}$ $n =$ Speed in rpm

Power $P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600}$ [kW] $\eta_v =$ Volumetric efficiency

Output speed $n = \frac{q_v \cdot 1000 \cdot \eta_v}{V_g}$ [rpm] $\eta_{mh} =$ Mechanical-hydraulic efficiency

$\eta_t =$ Overall efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

$T_k =$ Torque constant

Flushing and boost pressure valve

Before finalising your design request a certified installation drawing. Dimensions in mm.

Ordering Option N007

This valve assembly is used to flush an unacceptable heat load out of the closed loop circuit, and to maintain the necessary minimum boost pressure (16 bar, fixed setting). The valve is integrated into the port plate.

A built-in fixed orifice determines the flushing flow, which is taken out of the low pressure side of the loop and directed into the motor housing. It leaves the housing together with the case drain flow. This combined flow is replenished with fresh oil by means of the boost pump.

Dimensions A10FM / A10FE

Standard flushing flow

With low press. side $p_{ND} = 20$ bar and an orifice dia. 1,6 mm: 5,5 L/min (sizes 23 - 63). Other orifice diameters are available, please state in clear text.

Further flushing flows for sizes 23 - 63 see table:

Flushing flow [L/min]	Orifice ϕ [mm]
3.5	1.2
5.5	1.6
9	2

Schematic

Port for	
A; B	Service line
L, L ₁	Case drain (L ₁ plugged)

Size (NG)	A ₁	A ₂
23/28	72	72
37/45	77	77
58/63	77	82

Anti cavitation valve

Ordering option N002

When stopping a system with a relatively large mass (i.e. fan drive) the anti-cavitation valve provides fluid to the motor inlet during the coasting time.

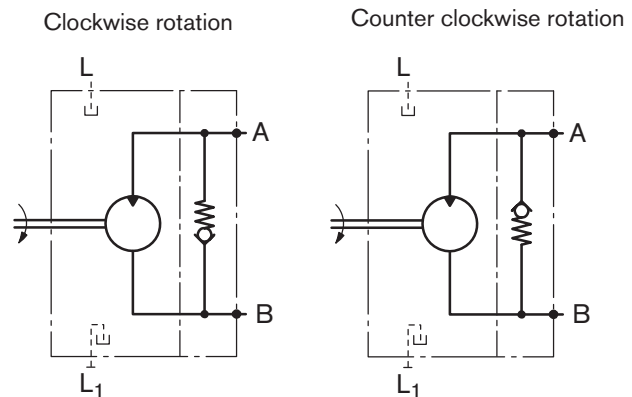

The valve assembly is integrated inside the port plate.

Important

It is necessary to specify a direction of rotation (clockwise or counter clockwise) looking at the shaft end of the motor.

The outside dimensions are identical to the standard units except the A10FE 11 - 18 with the 8-hole mounting flange, for the difference in length see unit dimensions.

Schematic

Port for	
A; B	Service line
L, L ₁	Case drain (L ₁ plugged)

Speed sensor

Ordering option D

The version A10FM...D comprises gearing around the rotary unit (prepared for speed pickup).

In this case, the rotating cylinder barrel can provide a speed dependent signal, which can be picked up by a suitable sensor and processed for further evaluation. Sensor port (D) will be closed for delivery.

A motor, prepared for speed sensing will be delivered without the necessary accessory parts which must be ordered separately.

Inductive speed sensor ID R 18/20-L250 (see RE 95130) and mounting parts (spacer and 2 seals per kit) can be ordered separately with the following part numbers:

Size (NG)	Ordering Nr.	Nr. of teeth
23/28	R902428802	48
37/45	R902433368	48
58/63	in preparation	9

Installation instructions

General

At all times, the axial piston unit must be filled with fluid and air bled during commissioning and operation. This must also be observed after a prolonged period of standstill as the system may drain back to the reservoir via the hydraulic lines.

The case drain fluid in the motor housing must be directed to tank via the highest available tank port and must drain the fluid below the minimum fluid level in the reservoir.

Installation position

See following examples 1 to 8.

Recommended installation positions: 1 and 3 resp. 2 and 4.
Additional installation positions are available on request.

Below reservoir installation (standard)

Below reservoir installation means, that the motor is mounted below the minimum fluid level.

Above reservoir installation

Above reservoir installation means, that the motor is mounted above the minimum fluid level. A check valve in the case drain line is only permissible under certain conditions; please consult us.

Install. position	Air bleed	Filling
1, 2	-	L ₁
3, 4	-	L

Install. position	Air bleed	Filling
5, 6	F	L ₁ (F)
7, 8	F	L (F)

L/L₁ = Case drain port, F = Air bleed resp. filling port, SB = Baffle.

General instructions

- The motor A10FM and A10FE has been designed to be used in open and closed circuits.
- Project planning, assembly and commissioning of the axial piston unit require the involvement of qualified personnel.
- Before operating the axial piston unit read the relevant operating manual thoroughly and completely. If needed request this information from Rexroth
- During and shortly after operation, there is a risk of burns on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
 - Pressure ports:
The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified operating conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
- The service line ports and function ports are only designed to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to DIN 13849.
- The following tightening torques apply:
 - Fittings:
Observe the manufacturer's instructions regarding the tightening torques of the fittings used.
 - Mounting bolts:
For fixing screws with metric ISO thread according to DIN 13 or thread according to ASME B1.1, we recommend checking the tightening torque individually according to VDI 2230.
 - Mounting bolts threads and threaded ports in the axial piston unit:
The maximum permissible tightening torques $M_{G \max}$ are maximum values for the female threads and must not be exceeded. For values, see the following table.
 - Threaded plugs:
For the threaded plugs, supplied with the axial piston unit, the required tightening torques M_V apply. For values, see the following table.

Ports Standard	Thread sizes	Maximum permissible tightening torque for the female threads $M_{G \max}$	Required tightening torque for the threaded plugs M_V	WAF hexagon socket of the threaded plugs
DIN 3852	M14 x 1.5	80 Nm	35 Nm ¹⁾	6 mm
	M18 x 1.5	140 Nm	60 Nm ¹⁾	8 mm
	M27 x 2	330 Nm	135 Nm ¹⁾	12 mm
ISO 11926	3/4-16 UNF-2B	160 Nm	62 Nm	5/16 in
	7/8-14 UNF-2B	240 Nm	110 Nm	3/8 in

1) The tightening torques apply for screws in the "dry" state as received on delivery and in the "lightly oiled" state for installation.

A6VM Series 63

RE-E 91604

Edition: 05.2016

Replaces: 06.2012

Europe

- ▶ All-purpose high pressure motor
- ▶ Sizes 28:
 - Nominal pressure 400 bar
 - Maximum pressure 450 bar
- ▶ Sizes 250 to 1000:
 - Nominal pressure 350 bar
 - Maximum pressure 400 bar
- ▶ Open and closed circuits

Features

- ▶ Robust motor with long service life
- ▶ Approved for very high rotational speeds
- ▶ High control range (can be swiveled to zero)
- ▶ High torque
- ▶ Variety of controls
- ▶ Optionally with flushing and boost-pressure valve mounted
- ▶ Optionally with integrated or mounted counterbalance valve
- ▶ Bent-axis design

Notice
 ▶ Note the project planning notes on page 54.
 ▶ In addition to the type code, please specify the relevant technical data when placing your order.

7) Please contact us.
 8) Specify type code separately for sensor in accordance with data sheet 95132 – DSM or 95133 – DSA, 95135 – HDD and observe the requirements for the electronics.

Hydraulic fluids

The A6VM variable motor is designed for operation with HLP mineral oil according to DIN 51524. Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)
- ▶ 990223: Fire-resistant, water-containing hydraulic fluids (HFC, HFB)
- ▶ 90225: Axial piston units for operation with water-free and water-containing fire-resistant hydraulic fluids (HFDR, HFDU, HFB, HFC).

The variable motor A6VM is not suitable for operation with HFA fluids. If operating with HFB-, HFC- and HFD or environmentally acceptable hydraulic fluids, the limitations regarding technical data or other seals must be observed.

Viscosity and temperature of hydraulic fluids

	Viscosity	Temperature	Comment
Cold start ¹⁾	$\nu_{\max} \leq 1600 \text{ mm}^2/\text{s}$	$\theta_{\text{St}} \geq -40 \text{ }^\circ\text{C}$	$t \leq 3 \text{ min}$, $n \leq 1000 \text{ rpm}$, without load $p \leq 50 \text{ bar}$
Permissible temperature difference		$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid in the system
Warm-up phase	$\nu = 1600 \text{ to } 400 \text{ mm}^2/\text{s}$	$\theta = -40 \text{ }^\circ\text{C to } -25 \text{ }^\circ\text{C}$	at $p \leq 0.7 \times p_{\text{nom}}$, $n \leq 0.5 \times n_{\text{nom}}$ and $t \leq 15 \text{ min}$
Continuous operation	$\nu = 400 \text{ to } 10 \text{ mm}^2/\text{s}$		This corresponds, for example on the VG 46, to a temperature range of $+5 \text{ }^\circ\text{C to } +85 \text{ }^\circ\text{C}$ (see selection diagram)
		$\theta = -25 \text{ }^\circ\text{C to } +103 \text{ }^\circ\text{C}$	Note the permissible temperature range of the shaft seal measured at port T ($\Delta T = \text{approx. } 12 \text{ K}$ between the bearing/shaft seal and port T)
	$\nu_{\text{opt}} = 36 \text{ to } 16 \text{ mm}^2/\text{s}$		Range of optimum operating viscosity and efficiency
Short-term operation	$\nu_{\min} \geq 7 \text{ mm}^2/\text{s}$		$t < 3 \text{ min}$, $p < 0.3 \times p_{\text{nom}}$

1) For application cases below $-25 \text{ }^\circ\text{C}$, an NBR shaft seal is required (permissible temperature range $-40 \text{ }^\circ\text{C to } +90 \text{ }^\circ\text{C}$).

▼ Selection diagram

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit. A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At very high hydraulic fluid temperatures (90 °C to maximum 103 °C, measured at port **T**), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

Effect of case pressure on beginning of control

An increase in case pressure affects the beginning of control of the variable motor when using the following control options:

- ▶ HD, HA.T3: increase
- ▶ HD, EP, HA, HA.T (Sizes 250 to 1000): increase
- ▶ DA: decrease

With the following settings, an increase in case pressure will have no effect on the beginning of control:

HA.R and HA.U, EP, HA

The factory settings for the beginning of control are made at $p_{abs} = 2$ bar (size 28) and $p_{abs} = 1$ bar (sizes 250 to 1000) case pressure.

Flow direction

Direction of rotation, viewed on drive shaft	
clockwise	counter-clockwise
A to B	B to A

Bearing

Long-life bearing, NG250-1000

For long service life and use with HF hydraulic fluids. Identical external dimensions as motor with standard bearings. Subsequent conversion to long-life bearings is possible.

Flushing

Flushing flow (recommended)

Size	250	355	500	1000
$q_{v\ flush}$ [l/min]	10	16	16	16

To reduce the leakage temperature, external case flushing is possible via port **U** or internally via a flushing valve.

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the rotational speed of the axial piston unit and the leakage pressure in the housing (case pressure). Momentary ($t < 0.1$ s) pressure peaks of up to 10 bar are allowed. Case pressures of a continuous 2 bar maximum are permitted to be able to utilize the entire speed range. Higher case pressures are permissible at lower rotational speeds (see diagram).

The service life of the shaft seal decreases with increasing frequency of pressure peaks and increasing mean differential pressure.

The case pressure must be equal to or higher than the ambient pressure.

▼ **Size 28**

▼ **Sizes 250 to 1000**

The FKM shaft seal ring may be used for leakage temperatures from -25 °C to +115 °C. For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

Working pressure range

Pressure at working port A or B		Definition	
Nominal pressure p_{nom}	NG28	400 bar	The nominal pressure corresponds to the maximum design pressure.
	NG250 to 1000	350 bar	
Maximum pressure p_{max}	NG28	450 bar	The maximum pressure corresponds to the maximum working pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.
	NG250 to 1000	400 bar	
Single operating period		10 s	
Total operating period		300 h	
Minimum pressure (high-pressure side)		25 bar	Minimum pressure at the high-pressure side (A or B) required to prevent damage to the axial piston unit.
Minimum pressure – operation as a pump (inlet)		See diagram below	To avoid damage to the axial piston motor during operation as a pump (change of the high-pressure side at constant direction of rotation, e.g. during braking processes) a minimum pressure has to be ensured at the working port (inlet). The minimum required pressure is dependent on the rotational speed and displacement of the axial piston unit (see characteristic curve).
Summation pressure p_{Su} (pressure A + pressure B)		700 bar	The summation pressure is the sum of the pressures at the ports for the working lines (A and B)
Rate of pressure change $R_{A\ max}$			Maximum permissible rate of pressure build-up and reduction during a pressure change across the entire pressure range.
with built-in pressure relief valve		9000 bar/s	
without pressure relief valve		16000 bar/s	

▼ Rate of pressure change $R_{A\ max}$

▼ Pressure definition

Total operating period = $t_1 + t_2 + \dots + t_n$

▼ Minimum pressure – operation as a pump (inlet)

This diagram is only valid for the optimum viscosity range of $\nu_{opt} = 36$ to $16 \text{ mm}^2/\text{s}$.

If the above mentioned conditions cannot be ensured please contact us.

Notice

Working pressure range valid when using hydraulic fluids based on mineral oils. Values for other hydraulic fluids, please contact us.

1) For size 28

2) For sizes 250 to 1000

Speed range

The minimum rotational speed n_{min} is not restricted. Please consult us regarding applications requiring uniformity of the rotary motion at low speeds.

Notice

- ▶ Theoretical values, without efficiency and tolerances; values rounded
- ▶ Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, such as speed variation, reduced angular acceleration as a function of the frequency and the permissible angular acceleration at start (lower than the maximum angular acceleration) can be found in data sheet 90261.

Permissible displacement in relation to rotational speed

Determining the operating characteristics

Inlet flow	$q_v = \frac{V_g \times n}{1000 \times \eta_v}$	[l/min]
Rotational speed	$n = \frac{q_v \times 1000 \times \eta_v}{V_g}$	[rpm]
Torque	$T = \frac{V_g \times \Delta p \times \eta_{hm}}{20 \times \pi}$	[Nm]
Power	$P = \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p \times \eta_t}{600}$	[kW]

Key

V_g	Displacement per revolution [cm ³]
Δp	Differential pressure [bar]
n	Rotational speed [rpm]
η_v	Volumetric efficiency
η_{hm}	Hydraulic-mechanical efficiency
η_t	Total efficiency ($\eta_t = \eta_v \times \eta_{hm}$)

1) The minimum and maximum displacement can be steplessly adjusted, see type code on page 3. (standard setting for sizes 250 to 1000 if ordering code is missing:

$$V_{g \min} = 0.2 \times V_{g \max}, V_{g \max} = V_{g \max}.$$

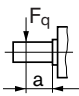

2) The values are applicable:

- for the optimum viscosity range from $\nu_{\text{opt}} = 36$ to 16 mm²/s
- with hydraulic fluid based on mineral oils

3) Torque without radial force, with radial force, see page 9.

4) Values in this range on request

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

▼ **Toothed gear output drive**

- 1 “Counter-clockwise” rotation. Pressure at port B
- 2 “Clockwise” rotation, pressure at port A
- 3 Bidirectional direction of rotation

Notice

- ▶ The values given are maximum values and do not apply to continuous operation.
- ▶ The permissible axial force in direction $-F_{ax}$ is to be avoided as the lifetime of the bearing is reduced.
- ▶ Special requirements apply in the case of belt drives. Please contact us.

1) When at standstill or when axial piston unit working in depressurized conditions. Higher forces are permissible under pressure, please contact us.
 2) Please contact us.

HD – Proportional control, hydraulic

The proportional hydraulic control provides infinite adjustment of the displacement. The control is proportional to the pilot pressure at port **X**.

HD1, HD2, HD3

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum rotational speed at minimum pilot pressure).
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed, at maximum pilot pressure).

Notice

- ▶ Maximum permissible pilot pressure: $p_{St} = 100$ bar
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Please note that at port **G** up to 450 bar (size 28) or 400 bar (sizes 250 to 1000) can occur.
- ▶ Specify the desired beginning of control in plain text when ordering, e.g.: beginning of control at 10 bar.
- ▶ The beginning of control and the HD-characteristic curve are influenced by case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 7) and thus a parallel displacement of the characteristic curve.
- ▶ A leakage flow of maximum 0.3 l/min can occur at port **X** due to internal leakage (working pressure > pilot pressure). The control is to be suitably configured to avoid an independent build-up of pilot pressure.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for size 28

HD1, HD2 without damping.

HD.D, HD.E with throttle pin on both sides, symmetrical (see table)

Option for size 28

HD1, HD2, with throttle pin on both sides, symmetrical (see table)

▼ Throttle pin overview

HD1, HD2 and HD3 with orifice ($\varnothing 1.2$ mm)

HD.D, HD.E, HP.G with adjustable response time limiting valve with orifice ($\varnothing 1.2$ mm)

HD1, pilot pressure increase $\Delta p_{St} = 10$ bar

A pilot pressure increase of 10 bar at port **X** will cause a reduction in displacement from $V_{g \max}$ to 0 cm³ (size 28) or from $V_{g \max}$ to 0.2 $V_{g \max}$ (sizes 250 to 1000).

Beginning of control, setting range 2 to 20 bar

Standard setting: beginning of control at 3 bar (end of control at 13 bar)

▼ Characteristic curve

HD2, pilot pressure increase $\Delta p_{St} = 25$ bar

A pilot pressure increase of 25 bar at port **X** results in a reduction in displacement from $V_{g \max}$ to 0 cm³ (size 28) or from $V_{g \max}$ to 0.2 $V_{g \max}$ (sizes 250 to 1000).
 Beginning of control, setting range 5 to 35 bar
 Standard setting: beginning of control at 10 bar (end of control at 35 bar)

▼ **Characteristic curve**

▼ **Circuit diagram HD1, HD2, size 28**

▼ **Circuit diagram HD1, HD2, HD3, sizes 250 to 1000**

HD3, pilot pressure increase $\Delta p_{St} = 35$ bar

(sizes 250 to 1000)
 A pilot pressure increase of 35 bar at port **X** results in a reduction in displacement from $V_{g \max}$ to 0.2 $V_{g \max}$.
 Beginning of control, setting range 7 to 50 bar
 Standard setting: beginning of control at 10 bar (end of control at 45 bar)

▼ **Characteristic curve**

HD.D Pressure control, fixed setting

The pressure control overrides the HD control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger angle. The increase in displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

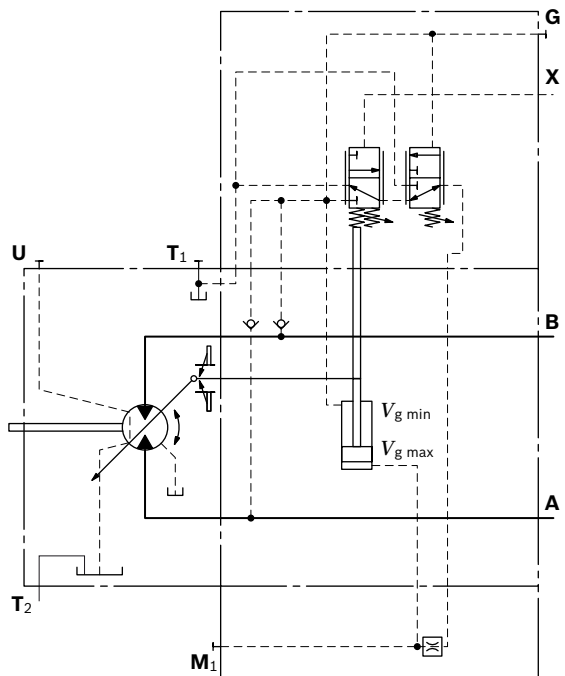

Size 28:

Setting range of the pressure control valve 80 to 400 bar

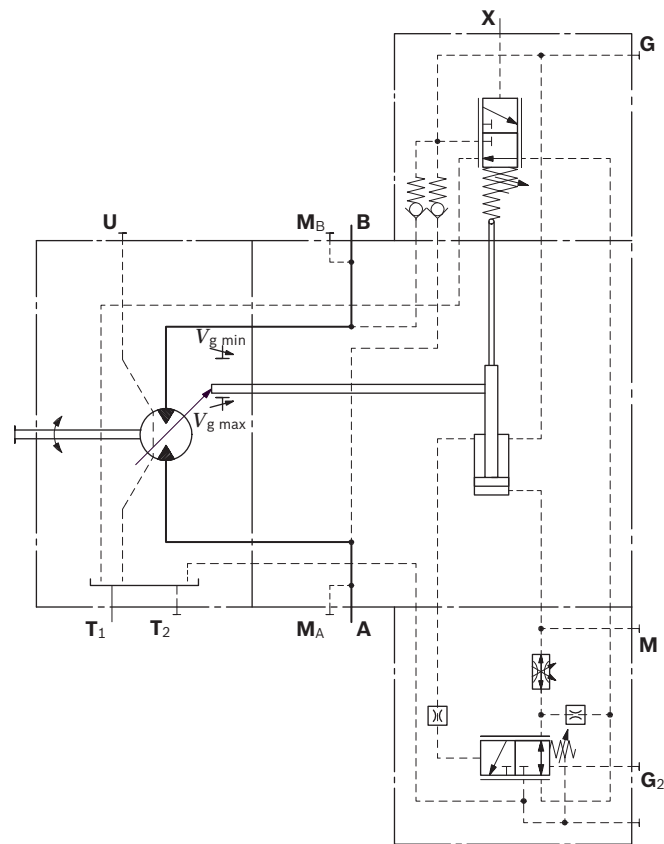

Sizes 250 to 1000:

Setting range of the pressure control valve 80 to 350 bar

▼ **Circuit diagram HD.D, size 28**

▼ **Circuit diagram HD.D, sizes 250 to 1000**

HD.E pressure control, hydraulic override, two-point, size 28

The pressure control setting can be overridden by applying an external pilot pressure at port **G₂**, realizing a 2nd pressure setting.

Necessary pilot pressure at port **G₂**:

$$p_{St} = 20 \text{ to } 50 \text{ bar}$$

When ordering, please specify the 2nd pressure setting in plain text.

▼ **Circuit diagram HD.E**

Sizes 250 to 1000 (HD.D)

Pressure control with 2nd pressure setting for HD.D provided as standard (see page 12).

The pressure control setting can be overridden by applying an external pilot pressure at port **G₂**, realizing a 2nd pressure setting.

Necessary pilot pressure at port **G₂**:

$$p_{St} \geq 130 \text{ bar}$$

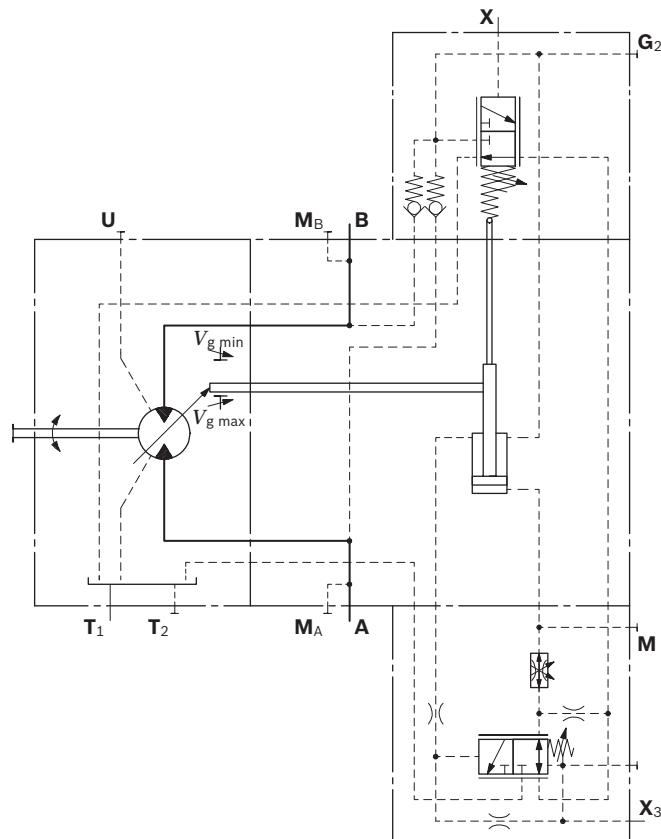

When ordering, please specify the 2nd pressure setting in plain text.

HD.G pressure control, remote controlled, sizes 250 to 1000

When the pressure command value is reached, the remote controlled pressure control continually regulates the motor to maximum displacement $V_{g \max}$. A pressure relief valve (not included in the scope of delivery), which is located separately from the motor and which is connected to port **X₃**, assumes the task of controlling the internal pressure cut-off valve. So long as the pressure command value has not been reached, pressure is evenly applied to the valve from both sides in addition to the spring force, and the valve remains closed. The pressure command value is between 80 bar and 350 bar. When the pressure command value is reached at the separate pressure-relief valve, this will open, relieving the pressure on the spring side to the reservoir. The internal control valve switches and the motor swivels to maximum displacement $V_{g \max}$.

The differential pressure at the DRG control valve is set as standard to 25 bar. As a separate pressure relief valve, we recommend: DBD 6 (hydraulic) as per data sheet 25402; maximum line length should not exceed 2 m.

▼ **Circuit diagram HD.G**

3

EP – Proportional control, electric

The electric control with proportional solenoid (size 28) or proportional valve (sizes 250 to 1000) enable the displacement to be steplessly adjusted. Control is proportional to the electric control current applied to the solenoid.

Sizes 250 to 1000 require an external pilot oil supply at port **P** with a pressure of $p_{\min} = 30 \text{ bar}$ ($p_{\max} = 100 \text{ bar}$).

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum rotational speed at minimum control current)
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed at maximum control current)

▼ Characteristic curve

Notice

- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures at port **G**, please contact us. Please note that at port **G** up to 450 bar (size 28) or 400 bar (sizes 250 to 1000) can occur.
- ▶ The following only needs to be noted for sizes 250 to 1000:
 - The beginning of control and the **EP** characteristic curve are influenced by the case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 6) and thus a parallel displacement of the characteristic curve.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for size 28

EP1, EP2 without damping.

EP.E pressure control, hydraulic override, two-point, size 28

The pressure control setting can be overridden by applying an external pilot pressure at port **G₂**, realizing a 2nd pressure setting realized. Necessary pilot pressure at port **G₂**: $p_{St} = 20$ to 50 bar

When ordering, please specify the 2nd pressure setting in plain text.

▼ **Circuit diagram EP.E**

Sizes 250 to 1000 (EP.D)

Pressure control with 2nd pressure setting for EP.D provided as standard (see page 16).

The pressure control setting can be overridden by applying an external pilot pressure at port **G₂**, realizing a 2nd pressure setting.

Necessary pilot pressure at port **G₂**:

$p_{St} \geq 100$ bar

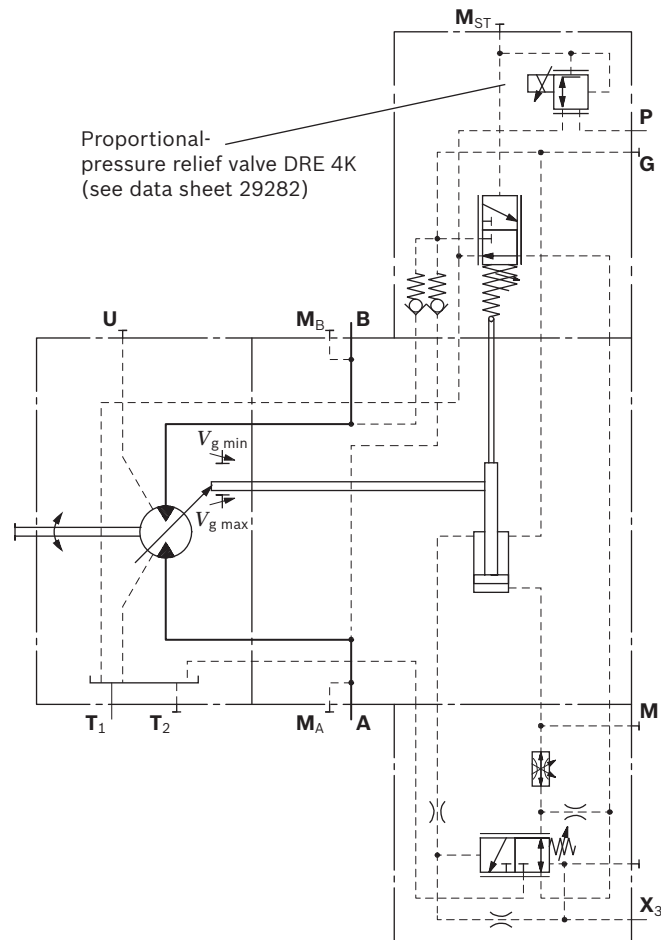

When ordering, please specify the 2nd pressure setting in plain text.

EP.G pressure control, remote controlled, sizes 250 to 1000

When the pressure command value is reached, the remote controlled pressure control continually regulates the motor to maximum displacement $V_{g \text{ max}}$. A pressure relief valve (not included in the scope of delivery), which is located separately from the motor and which is connected to port **X₃**, assumes the task of controlling the internal pressure cut-off valve. So long as the pressure command value has not been reached, pressure is evenly applied to the valve from both sides in addition to the spring force, and the valve remains closed. The pressure command value is between 80 bar and 350 bar. When the pressure command value is reached at the separate pressure-relief valve, this will open, relieving the pressure on the spring side to the reservoir. The internal control valve switches and the motor swivels to maximum displacement $V_{g \text{ max}}$.

The differential pressure at the DRG control valve is set as standard to 25 bar. As a separate pressure relief valve, we recommend: DBD 6 (hydraulic) as per data sheet 25402; maximum line length should not exceed 2 m.

▼ **Circuit diagram EP.G**

3

HZ – Two-point control, hydraulic

The two-point hydraulic control allows the displacement to be set to either $V_{g \text{ min}}$ or $V_{g \text{ max}}$ by switching the pilot pressure at port **X** on or off.

- ▶ Position at $V_{g \text{ max}}$ (without pilot pressure, maximum torque, minimum rotational speed)
- ▶ Position at $V_{g \text{ min}}$ (with pilot pressure > 15 bar for size 28 and 10 bar for sizes 250 to 1000 switched on, minimum torque, maximum permissible rotational speed)

▼ Characteristic curve

Notice

- ▶ Maximum permissible pilot pressure: 100 bar
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Please note that at port **G** up to 450 bar (size 28) or 400 bar (sizes 250 to 1000) can occur.
- ▶ A leakage flow of maximum 0.3 l/min can occur at port **X** due to internal leakage (working pressure > pilot pressure). The control is to be suitably configured to avoid an independent build-up of pilot pressure.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 28, 140 to 200

EZ – Two-point control, electric

The two-point electric control allows the displacement to be set to either $V_{g \min}$ or $V_{g \max}$ by switching the electric current on or off to a switching solenoid (size 28) or to an on/off valve (sizes 250 to 1000).

Notice

The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us.

Please note that at port **G** up to 450 bar (size 28) or 400 bar (sizes 250 to 1000) can occur.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

HA – Automatic high-pressure related control

The automatic high-pressure related control adjusts the displacement automatically depending on the working pressure.

The displacement of the A6VM motor with HA control is $V_{g \min}$ (maximum rotational speed and minimum torque). The control device measures internally the working pressure at **A** or **B** (no control line required) and upon reaching the set beginning of control, the controller swivels the motor with increasing pressure from $V_{g \min}$ to $V_{g \max}$. The displacement is modulated between $V_{g \min}$ and $V_{g \max}$ depending on the load.

HA1, HA2

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum rotational speed)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum rotational speed)

Notice

- ▶ For safety reasons, winch drives are not permissible with beginning of control at $V_{g \min}$ (standard for HA).
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Please note that at port **G** up to Please note that at port **G** up to 450 bar (size 28) or 400 bar (sizes 250 to 1000) can occur.
- ▶ The beginning of control and the HA characteristic curve are influenced by the case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 6) and thus a parallel displacement of the characteristic curve. Only for HA1T (size 28) and for HA1, HA2 and HA.T (sizes 250 to 1000).
- ▶ A leakage flow of maximum 0.3 l/min occurs at port X (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure must to be relieved from port X to the reservoir. **Only for HA.T control.**

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for size 28

HA with throttle pin on one side, throttle from $V_{g \min}$ to $V_{g \max}$. (see table)

▼ Throttle pin overview

Size	28
Groove size [mm]	0.3

Standard for sizes 250 to 1000 with orifice ($\varnothing 1.2$ mm)

HA1 with minimum pressure increase, positive control

A working pressure increase of $\Delta p \leq$ approx. 10 bar results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

Size 28:

Setting range of the pressure control valve 80 to 350 bar
 Sizes 250 to 1000:

Setting range of the pressure control valve 80 to 340 bar
 Please state the desired beginning of control in plain text when ordering, e.g.: beginning of control at 300 bar.

▼ Characteristic curve HA1

▼ Circuit diagram HA1, size 28

▼ Circuit diagram HA1, sizes 250 to 1000

HA2 with pressure increase, positive control

A working pressure increase of $\Delta p \leq$ approx. 100 bar results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

Size 28:

Setting range of the pressure control valve 80 to 350 bar

Sizes 250 to 1000:

Setting range of the pressure control valve 80 to 250 bar

Please state the desired beginning of control in plain text when ordering, e.g.: beginning of control at 200 bar.

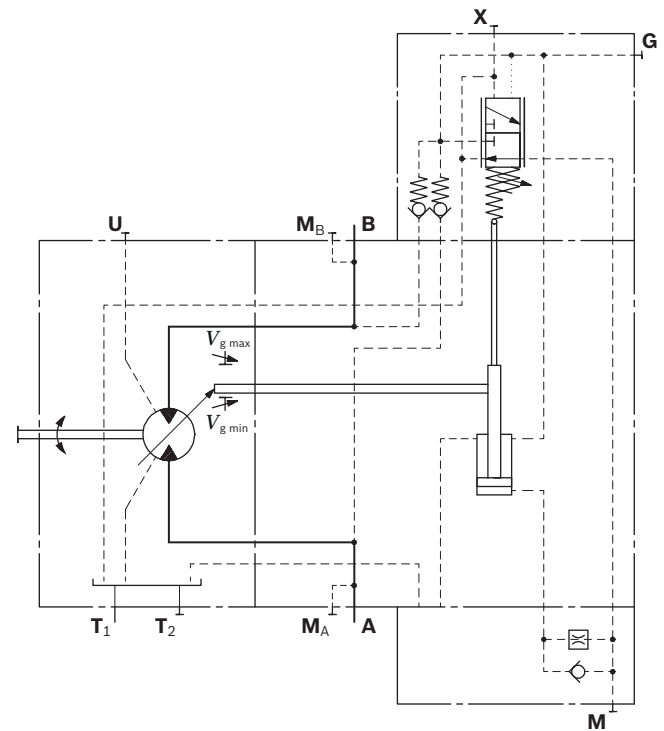

▼ Characteristic curve HA2

▼ Circuit diagram HA2, size 28

▼ Circuit diagram HA2, sizes 250 to 1000

HA.T Hydraulic override, remote control, proportional

With the HA.T3 control, the beginning of control can be influenced by applying a pilot pressure to port **X**.

For every 1 bar of pilot pressure, the beginning of control is reduced by 17 bar (size 28) or 9 bar (sizes 250 to 1000).

Example (size 28):

Settings for the beginning of control	300 bar	300 bar
Pilot pressure at port X	0 bar	10 bar
Beginning of control at	300 bar	130 bar

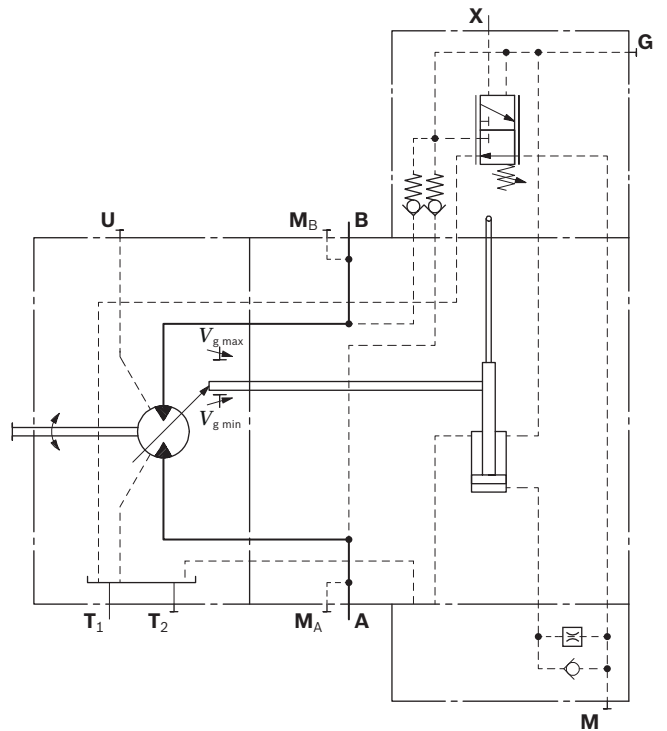

Notice

Maximum permissible pilot pressure 100 bar.

▼ **Circuit diagram HA1T, sizes 250 to 1000**

▼ **Circuit diagram HA2T, size 28**

HA.U1, HA.U2 electric override, two-point, size 28

With the HA.U1 or HA.U2 control, the beginning of control can be overridden by an electric signal to a switching solenoid. When the override solenoid is energized, the variable motor swivels to maximum swivel angle, without intermediate position.

The beginning of control can be set between 80 and 300 bar (specify required setting in plain text when ordering).

Technical data, solenoid with Ø45	U1	U2
Voltage	12 V (±20%)	24 V (±20%)
No override	de-energized	de-energized
Position $V_{g \max}$	energized	energized
Nominal resistance (at 20 °C)	4.8 Ω	19.2 Ω
Nominal power	30 W	30 W
Minimum active current required	1.5 A	0.75 A
Duty cycle	100%	100%
Type of protection: see connector version page 47		

▼ **Circuit diagram HA1.U1, HA1.U2**

▼ **Circuit diagram HA2.U1, HA2.U2**

HA.R1, HA.R2 electric override, travel direction valve electric, size 28

With the HA.R1 or HA.R2 control, the beginning of control can be overridden by an electric signal to switching solenoid **b**. When the override solenoid is energized, the variable motor swivels to maximum swivel angle, without intermediate position.

The travel direction valve ensures that the preselected pressure side of the hydraulic motor (**A** or **B**) is always connected to the HA control, and thus determines the swivel angle, even if the high-pressure side changes (e.g. -travel drive during a downhill operation). This thereby prevents undesired swiveling of the variable motor to a larger displacement (jerky deceleration and/or braking characteristics).

Depending on the direction of rotation (direction of travel), the travel direction valve is actuated through the compression spring or the switching solenoid **a** (see page 30).

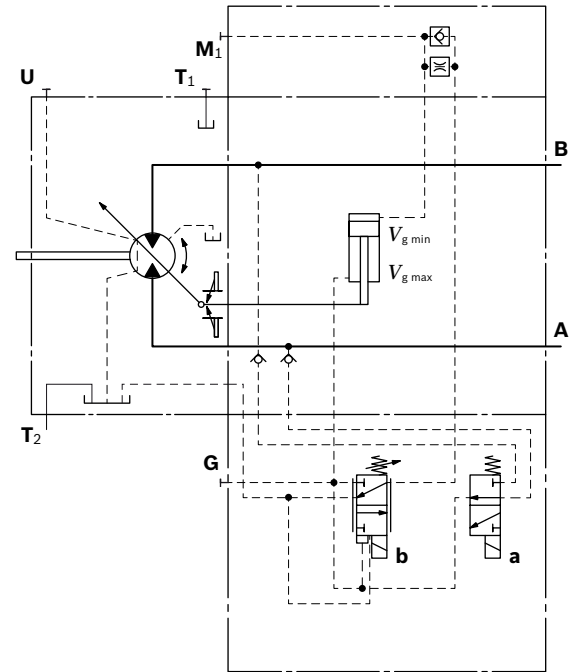

Electric override

Technical data, solenoid b with $\varnothing 45$	R1	R2

DA – Automatic control, speed related

The variable motor A6VM with automatic speed-related control is intended for use in hydrostatic travel drives in combination with the variable pump A4VG with DA control. A drive speed-related pilot pressure signal is generated by the A4VG variable pump, and that signal, together with the working pressure, regulates the swivel angle of the hydraulic motor.

Increasing drive speed, i.e. increasing pilot pressure, causes the motor to swivel to a smaller displacement (lower torque, higher rotational speed), depending on the working pressure.

If the working pressure exceeds the pressure command value of the controller, the variable motor swivels to a larger displacement (higher torque, lower rotational speed).

- ▶ Pressure ratio $p_{st}/p_{HD} = 3/100, 5/100, 8/100$

DA control is only suitable for certain types of travel drive systems and requires review of the engine and vehicle parameters to ensure that the motor is used correctly and that machine operation is safe and efficient. We recommend that all DA applications be reviewed by a Bosch Rexroth application engineer.

Our Sales department will provide you detailed information.

Notice

The beginning of control and the DA characteristic curve are influenced by case pressure. An increase in the case pressure causes a decrease / reduction in the beginning of control (see page 6) and thus a parallel displacement of the characteristic curve.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for size 28

Electric travel direction valve (for DA, HA.R)

Application in travel drives in closed circuits. The travel direction valve of the motor is actuated by an electric signal that also switches the swivel direction of the travel drive pump (e.g. A4VG with DA control valve).

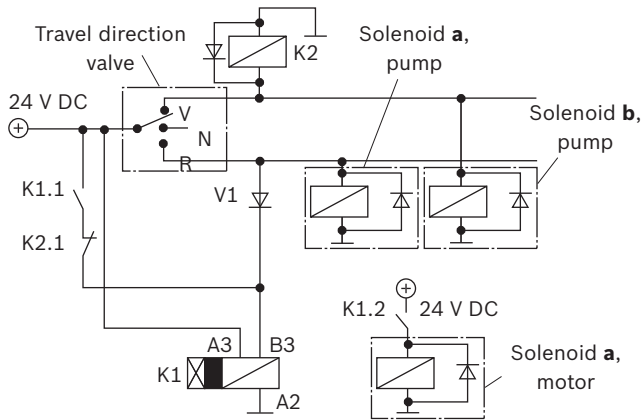

If the pump in the closed circuit is switched to the neutral position or into reverse, the vehicle may experience jerky deceleration or braking, depending on the vehicle weight and current travel speed.

When the travel direction valve, which must be logically coordinated with the pump control, of the pump (e.g. 4/3-way directional valve of the DA-control) is switched to

- ▶ the neutral position, the electrical circuitry causes the previous signal on the travel direction valve on the motor to be retained.
- ▶ Reversing, the electrical circuitry causes the travel direction valve of the motor to switch to the other travel direction following a time delay (approx. 0.8 s) with respect to the pump.

As a result, jerky deceleration or braking is prevented in both cases.

▼ Circuit diagram, electric travel direction valve

Notice

Connector for solenoids

DEUTSCH DT04-2P-EP04

Size 28

Molded connector, 2-pin, without bidirectional suppressor diode

The following type of protection ensues with an installed mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

▼ Switching symbol

▼ Mating connector DEUTSCH DT06-2S-EP04

Consisting of	DT designation
1 housing	DT06-2S-EP04
1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery. This can be supplied by Bosch Rexroth on request (material number R902601804).

Notice

- ▶ If necessary, you can change the position of the connector by turning the solenoid.
- ▶ The procedure is defined in the instruction manual.

HIRSCHMANN DIN EN 175 301-803-A/ISO 4400

Sizes 250 to 1000

Without bidirectional suppressor diode

Type of protection:

- ▶ IP65 (DIN/EN 60529)

The seal ring in the cable fitting is suitable for lines of diameter 4.5 mm to 10 mm.

The mating connector is included in the scope of delivery.

Flushing and boost-pressure valve

The flushing and boost-pressure valve is used to remove heat from the hydraulic circuit.

In a closed circuit, it is used for flushing the case and safeguarding the minimum boost pressure. Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the leakage. In the closed circuit, the removed hydraulic fluid must be replaced by cooled hydraulic fluid supplied by the boost pump.

The valve is mounted on the port plate or integrated (depending on the control type and size).

Cracking pressure of pressure retaining valve

(observe when setting the primary valve)

- ▶ sizes 28, 250 to 1000, fixed setting 16 bar

Switching pressure of flushing spool Δp

- ▶ size 28, 8 ± 1 bar
- ▶ sizes 250 to 1000, 17.5 ± 1.5 bar

Flushing flow q_v

Orifices can be used to adjust the flushing flows as required. The following parameters are based on:

$$\Delta p_{ND} = p_{ND} - p_G = 25 \text{ bar and } v = 10 \text{ mm}^2/\text{s}$$

(p_{ND} = low pressure, p_G = case pressure)

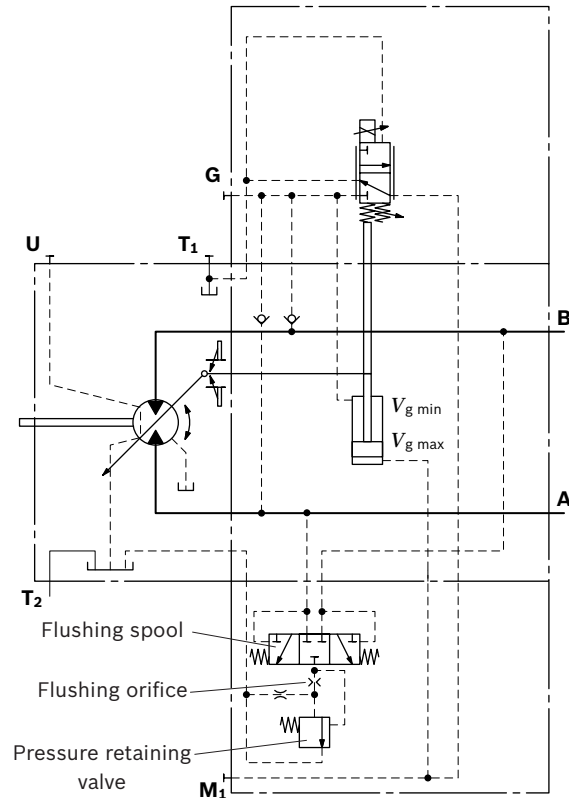

Flushing valve for size 28

Material number of orifice	ϕ [mm]	q_v [l/min]
R909651766	1.2	3.5
R909419695	1.4	5

Flushing valve for sizes 250 to 1000

NG	A1	A2
250	357	402
355	397	446
500	440	504
1000	552	629

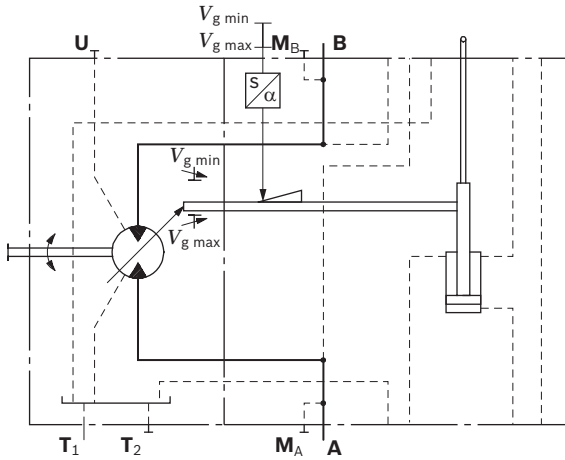

Swivel angle indicator

Optical (V)

The swivel position is indicated by a pin on the side of the port plate. The length of pin protruding depends on the position of the lens plate.

If the pin is flush with the port plate, the motor is at the beginning of control. At maximum swivel, the pin length is 8 mm (visible after removing the cap nut).

▼ **Example: Beginning of control at $V_{g \max}$**

NG	A1	A2 ²⁾	A3	A4	A5 ³⁾	A6
250	136.5	256	73	238	11	5
355	159.5	288	84	266	11	8
500	172.5	331	89	309	11	3
1000	208.5	430	114	402	11	3

- 1) Width across flats
- 2) Dimension to mounting flange
- 3) Required clearance for removal of cap nut

Electric (E)

The motor position is detected by an inductive position transducer. This converts the travel of the control device into an electric signal.

This signal is used to forward the swivel position to an electric control unit.

Inductive position transducer

Type of protection:

- ▶ IP65 (DIN/EN 60529)

▼ **Example: Beginning of control at $V_{g \max}$**

NG	A1	A2 ²⁾	A3	A4	A6
250	185	256	73	238	5
355	208	288	84	266	8
500	221	331	89	309	3
1000	257	430	114	402	3

Speed sensor

Version A6VM...U (“prepared for speed sensor”, i.e. without sensor) is equipped with a spline on the rotary group.

A signal proportional to motor rotational speed can be generated with the DSA/DSM or HDD speed sensor mounted. The DSA/DSM sensor registers the rotational speed and direction of rotation.

Type code, technical data, dimensions and parameters for the connector, plus safety instructions about the sensor can be found in the relevant data sheet 95132 – DSM, 95133 – DSA or 95135 – HDD.

The sensor is mounted on the port provided for this purpose with a mounting bolt. On deliveries without sensor, the port is plugged with a pressure-resistant cover. We recommend ordering the A6VM variable motor complete with mounted sensor.

1) On request

Installation instructions

General

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit may empty via the hydraulic lines.

Particularly in the installation position “drive shaft upwards”, filling and air bleeding must be carried out completely as there is, for example, a danger of dry running. The leakage in the housing area must be directed to the reservoir via the highest drain port (**T₁**, **T₂**).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the maximum permissible case pressure of all connected units is not exceeded at any operational conditions. If this is not possible, separate drain lines must be laid.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Notice

In certain installation positions, an influence on the control characteristic can be expected. Gravity, dead weight and case pressure can cause minor characteristic shifts and changes in response time.

Key	
F	Filling / air bleeding
U	Bearing flushing / air bleed port
T₁, T₂	Drain port
$h_{t\ min}$	Minimum required immersion depth (200 mm)
h_{min}	Minimum required distance to reservoir bottom (100 mm)

Installation position

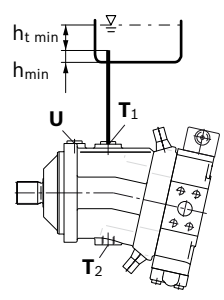

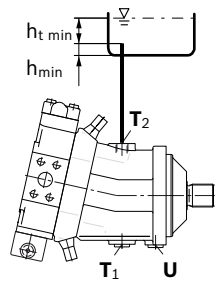

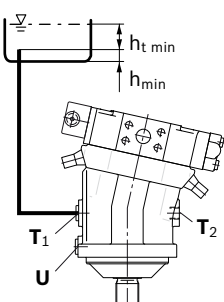

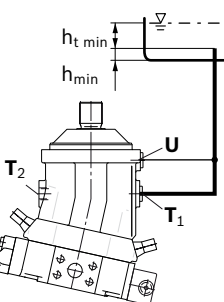

See the following examples **1** to **8**.

Further installation positions are available upon request.

Recommended installation position: **1** and **2**

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir and below the minimum fluid level of the reservoir.

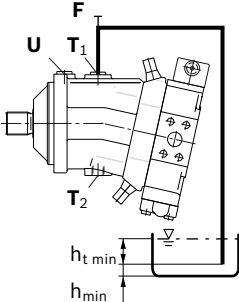

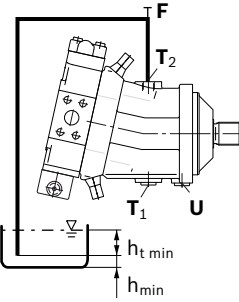

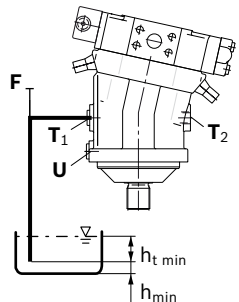

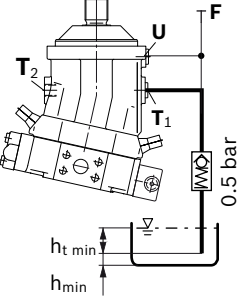

Installation position	Air bleed	Filling
1 		T₁
2 		T₂
3 		T₁
4 	U	T₁

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Recommendation for installation position 8 (drive shaft upward):

A check valve in the reservoir line (cracking pressure 0.5 bar) can prevent draining of the housing area.

Installation position	Air bleed	Filling
<p>5</p> 	U (F)	T ₁ (F)
<p>6</p> 	F	T ₂ (F)
<p>7</p> 	F	T ₁ (F)
<p>8</p> 	U	T ₁ (F)

Notice

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

Project planning notes

- ▶ The motor A6VM is designed to be used in open and closed circuits.
- ▶ The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified skilled personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes contained herein must be observed.
- ▶ For safety reasons, controls with beginning of control at $V_{g \min}$ (e.g., HA) are not permissible for winch drives (e.g. anchor winches)!
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or the instruction manual.
- ▶ Not all variants of the product are approved for use in safety functions according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. When a direct current is applied, solenoids do not cause electromagnetic interference nor is their operation impaired by electromagnetic interference.
Other behavior can result when a modulated direct current (e.g. PWM signal) is applied. Potential electromagnetic interference for persons (e.g. persons with a pacemaker) and other components must be tested by the machine manufacturer.
- ▶ Please note the details regarding the tightening torques of port threads and other threaded joints in the instruction manual.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports are only intended to accommodate hydraulic lines.

Safety instructions

- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).

- ▶ Moving parts in control equipment (e.g. valve spools) can, under certain circumstances get blocked in position as a result of contamination (e.g. impure hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filter) will not rule out a fault but merely reduce the risk.

The machine/system manufacturer must check whether additional measures are required on the machine for the relevant application in order to bring the driven consumer into a safe position (e.g. safe stop) and ensure any measures are properly implemented.

- ▶ Moving parts in high-pressure relief valves may in certain circumstances become stuck in an undefined position due to contamination (e.g. contaminated hydraulic fluid). This can result in restriction or loss of the load holding function in lifting winches.

The machine/system manufacturer must check whether additional measures are required on the machine for the relevant application in order to keep the load in a safe position and ensure they are properly implemented.

- ▶ When using the axial piston motor in winch drives, make certain that the technical limit values are not exceeded under all operating conditions. If the axial piston motor is extremely overloaded (e.g., if the maximum permissible rotational speeds are exceeded during weighing of the anchor while the ship is in motion), the rotary group may be damaged and, in the worst case, the axial piston motor may burst. The machine manufacturer / system manufacturer is to undertake additional measures, up to and including encapsulation.

Axial piston variable motor A6VM series 65

RE 91607

- ▶ All-purpose high pressure motor
- ▶ Sizes 55 to 200
- ▶ Nominal pressure 400 bar
- ▶ Maximum pressure 450 bar
- ▶ Open and closed circuits

Features

- ▶ Robust motor with long service life
- ▶ Approved for very high rotational speeds
- ▶ High control range (can be swiveled to zero)
- ▶ High torque
- ▶ Variety of controls
- ▶ Optionally with flushing and boost-pressure valve mounted
- ▶ Optionally with mounted high-pressure counterbalance valve
- ▶ Bent-axis design

Hydraulic fluids

The variable motor A6VM is designed for operation with mineral oil HLP according to DIN 51524.

Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)
- ▶ 90223: Fire-resistant, water-containing hydraulic fluids (HFC, HFB)
- ▶ 90225: Axial piston units for operation with water-free and water-containing fire-resistant hydraulic fluids (HFDR, HFDU, HFB, HFC).

The variable motor A6VM is not suitable for operation with HFA fluids. If operating with HFB-, HFC- and HFD or environmentally acceptable hydraulic fluids, the limitations regarding technical data or other seals must be observed.

Notes on selection of hydraulic fluid

The hydraulic fluid should be selected such that the operating viscosity in the operating temperature range is within the optimum range (v_{opt} see selection diagram).

Note

At no point of the component may the temperature be higher than 115 °C. The temperature difference specified in the table is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend the use of a flushing and boost-pressure valve (see page 64).

Viscosity and temperature of hydraulic fluids

	Viscosity	Temperature	Comment
Cold start ¹⁾	$v_{min} \geq 1600 \text{ mm}^2/\text{s}$	$\theta_{St} \geq -40 \text{ °C}$	$t \leq 3 \text{ min}$, $n \leq 1000 \text{ rpm}$, without load $p \leq 50 \text{ bar}$
Permissible temperature difference		$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid in the system
Warm-up phase	$v = 1600 \text{ to } 400 \text{ mm}^2/\text{s}$	$\theta = -40 \text{ °C to } -25 \text{ °C}$	at $p \leq 0.7 \times p_{nom}$, $n \leq 0.5 \times n_{nom}$ and $t \leq 15 \text{ min}$
Continuous operation	$v = 400 \text{ to } 10 \text{ mm}^2/\text{s}$		This corresponds, for example on the VG 46, to a temperature range of +5 °C to +85 °C (see selection diagram)
			$\theta = -25 \text{ °C to } +103 \text{ °C}$
			measured at port T Note the permissible temperature range of the shaft seal ($\Delta T = \text{approx. } 12 \text{ K}$ between the bearing/shaft seal and port T)
	$v_{opt} = 36 \text{ to } 16 \text{ mm}^2/\text{s}$		Range of optimum operating viscosity and efficiency
Short-term operation	$v_{min} \geq 7 \text{ mm}^2/\text{s}$		$t < 3 \text{ min}$, $p < 0.3 \times p_{nom}$

1) For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range -40 °C to +90 °C).

▼ Selection diagram

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At very high hydraulic fluid temperatures (90 °C to maximum 103 °C, measured at port **T**), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

Influence of case pressure on beginning of control

An increase in case pressure affects the beginning of control of the variable motor when using the following control options:

- ▶ HP, HA.T3: increase
- ▶ DA: decrease

With the following settings, an increase in case pressure will have no effect on the beginning of control:

HA.R and HA.U, EP, HA

The factory setting of the beginning of control is made at $p_{abs} = 2$ bar case pressure.

Flow direction

Direction of rotation, viewed on drive shaft	
cw	ccw
A to B	B to A

Shaft seal

Permissible pressure loading

The service life of the shaft seal will be influenced by the speed of the axial piston unit and the leakage pressure in the housing (case pressure). Momentary pressure spikes ($t < 0.1$ s) of up to 10 bar are permitted. Case pressures of a continuous 2 bar maximum are permitted to be able to utilize the entire speed range. Higher case pressures are permissible at lower rotational speeds (see diagram). The service life of the shaft seal decreases with increasing frequency of pressure spikes and increasing mean differential pressure.

The case pressure must be equal to or higher than the ambient pressure.

The FKM shaft seal may be used for leakage temperatures from -25 °C to +115 °C. For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

Operating pressure range

Pressure at service line port A or B		Definition
Nominal pressure p_{nom}	400 bar	The nominal pressure corresponds to the maximum design pressure.
Maximum pressure p_{max}	450 bar	The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.
Single operating period	10 s	
Total operating period	300 h	
Minimum pressure (high-pressure side)	25 bar absolute	Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.
Minimum pressure – pump operating mode (inlet)	See the diagram below	To prevent damage to the axial piston motor in pump operating mode (change of high-pressure side with unchanged direction of rotation, e.g. when braking), a minimum pressure must be guaranteed at the service line port (inlet). This minimum pressure is dependent on the speed and displacement of the axial piston unit (see characteristic curve)
Summation pressure p_{Su} (pressure A + pressure B)	700 bar	The summation pressure is the sum of the pressures at both service line ports (A and B)
Rate of pressure change $R_{A\ max}$		Maximum permissible rate of pressure build-up and reduction during a pressure change over the entire pressure range.
With integrated pressure-relief valve	9000 bar/s	
Without pressure-relief valve	16000 bar/s	

▼ Rate of pressure change $R_{A\ max}$

▼ Pressure definition

Total operating period = $t_1 + t_2 + \dots + t_n$

▼ Minimum pressure – pump operating mode (inlet)

This diagram is valid only for the optimum viscosity range from $\nu_{opt} = 36$ to $16\text{ mm}^2/\text{s}$.

Please contact us if these conditions cannot be satisfied.

Notice

Operating pressure range valid when using hydraulic fluids based on mineral oils. Values for other hydraulic fluids, please contact us.

Technical data

Speed range

The minimum rotational speed n_{min} is not limited. For applications with requirements on the evenness of the rotation at low rotational speeds, please contact us.

Notice

- Theoretical values, without efficiency levels and tolerances; values rounded
- Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, such as speed variation, reduced angular acceleration as a function of the frequency and the permissible angular acceleration at start (lower than the maximum angular acceleration) can be found in data sheet 90261.

Permissible displacement in relation to speed

Determining the operating characteristics

Inlet flow	$q_v = \frac{V_g \times n}{1000 \times \eta_v}$	[l/min]
Rotational speed	$n = \frac{q_v \times 1000 \times \eta_v}{V_g}$	[rpm]
Torque	$T = \frac{V_g \times \Delta p \times \eta_{mh}}{20 \times \pi}$	[Nm]
Power	$P = \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p \times \eta_t}{600}$	[kW]

Key

V_g	=	Displacement per revolution [cm ³]
Δp	=	Differential pressure [bar]
n	=	Rotational speed [rpm]
η_v	=	Volumetric efficiency
η_{mh}	=	Mechanical-hydraulic efficiency
η_t	=	Total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

- The values are valid:
 - for the optimum viscosity range from $\nu_{\text{opt}} = 36$ to 16 mm²/s
 - with hydraulic fluid based on mineral oils
- Observe limitation of input flow due to counterbalance valve (see page 66).
- Torque without radial force, With radial force see page 10.
- Values in this range on request

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

▼ Toothed gear output drive

- 1 Direction of rotation “counter-clockwise”, pressure at port A
- 2 Direction of rotation “clockwise”, pressure at port B
- 3 Alternating direction of rotation

Notice

- ▶ The values given are maximum values and do not apply to continuous operation.
- ▶ The permissible axial force in direction $-F_{ax}$ is to be avoided as the lifetime of the bearing is reduced.
- ▶ Special requirements apply in the case of belt drives. Please contact us.

... ..

HP – Proportional hydraulic control

The proportional hydraulic control provides infinite adjustment of the displacement. Control is proportional to the pilot pressure applied to port **X**.

HP1, HP2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible speed at minimum pilot pressure)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum speed at maximum pilot pressure)

HP5, HP6 negative control

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum speed at minimum pilot pressure)
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible speed at maximum pilot pressure)

Notice

- ▶ Maximum permissible pilot pressure: $p_{St} = 100$ bar
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Bear in mind that pressures up to 450 bar can occur at port **G**.
- ▶ Specify the desired beginning of control in plain text when ordering, e.g.: beginning of control at 10 bar.
- ▶ The beginning of control and the HP characteristic curve are influenced by the case pressure. An increase in case pressure causes an increase in the beginning of control (see page 7) and thus a parallel shift of the characteristic.
- ▶ A leakage flow of maximum 0.3 l/min can occur at port **X** due to internal leakage (working pressure > pilot pressure). The control is to be suitably configured to avoid an independent build-up of pilot pressure.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 55 to 200

HP without damping.

HP.D with throttle pin on both sides, symmetrical (see table)

Optional for sizes 55 to 200

HP with throttle pin on both sides, symmetrical (see table)

▼ Throttle pin overview

Size	55	80	107	140	160	200
Groove size [mm]	0.45	0.45	0.55	0.55	0.55	0.65

HP1, HP5 pilot pressure increase $\Delta p_{St} = 10$ bar

HP1 positive control

A pilot pressure increase of 10 bar at port **X** results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

HP5 negative control

A pilot pressure increase of 10 bar at port **X** results in a decrease in displacement from $V_{g \max}$ to $V_{g \min}$.
Beginning of control, setting range 2 to 20 bar
Standard setting: beginning of control at 3 bar (end of control at 13 bar)

▼ Characteristic curve

HP2, HP6 pilot pressure increase $\Delta p_{St} = 25$ bar

HP2 positive control

A pilot pressure increase of 25 bar at port **X** results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

HP6 negative control

A pilot pressure increase of 25 bar at port **X** results in a decrease in displacement from $V_{g \max}$ to $V_{g \min}$.

Beginning of control, setting range 5 to 35 bar

Standard setting:

beginning of control at 10 bar (end of control at 35 bar)

▼ **Characteristic curve**

▼ **Circuit diagram HP5, HP6 (negative control)**

▼ **Circuit diagram HP1, HP2 (positive control)**

HP5D1, HP6D1 Pressure control, fixed setting

The pressure control overrides the HP control function.

If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger displacement.

The increase in the displacement and the resulting reduction in pressure cause the control deviation to decrease.

With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve 80 to 400 bar

▼ **Circuit diagram HP5D1, HP6D1 (negative control)**

EP – Proportional electric control

The proportional electric control, type EP, provides infinite adjustment of the displacement, proportional to the control current applied to the solenoid.

EP1, EP2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible speed at minimum control current)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum speed at maximum control current)

EP5, EP6 negative control

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum speed at minimum control current)
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible speed at maximum control current)

▼ Characteristic curve

Notice

The control oil is internally taken from the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 450 bar can occur at port **G**.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 55 to 200

EP without damping.

EP.D with throttle pin on both sides, symmetrical (see table)

Optional for sizes 55 to 200

EP with throttle pin on both sides, symmetrical (see table)

Various BODAS controllers with application software and amplifiers are available for controlling the proportional solenoids.

¹⁾ Minimum required oscillation range of the control current $\Delta I_{p,p}$ (peak to peak) within the respective control range (start of control to end of control)

▼ Circuit diagram EP1, EP2 (positive control)

▼ Circuit diagram EP5, EP6 (negativ control)

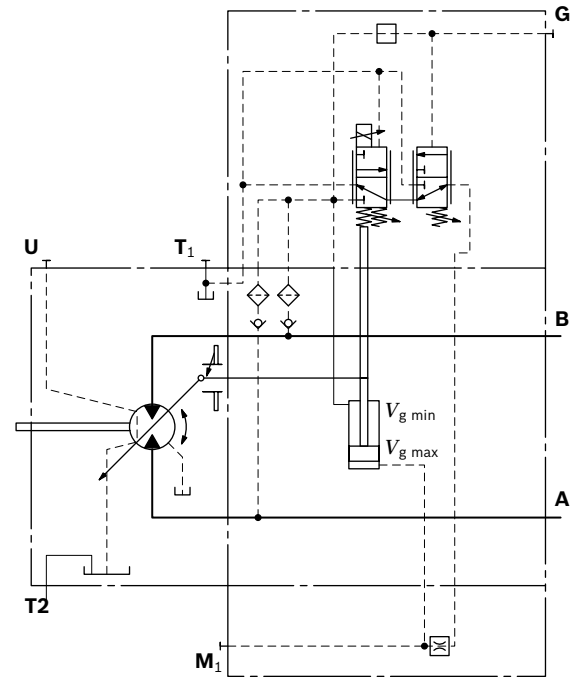

EP5D1, EP6D1 Pressure control, fixed setting

The pressure control overrides the EP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger displacement.

The increase in the displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve 80 to 400 bar

▼ Circuit diagram EP5D1, EP6D1 (negativ control)

HZ – Two-point hydraulic control

The two-point hydraulic control allows the displacement to be set to either $V_{g\ min}$ or $V_{g\ max}$ by switching the pilot pressure at port **X** on or off.

HZ5, HZ7 negative control

- ▶ Position at $V_{g\ max}$ (without pilot pressure, maximum torque, minimum speed)
- ▶ Position at $V_{g\ min}$ (with pilot pressure > 15 bar activated, minimum torque, maximum permissible speed)

▼ Characteristic curve HZ5, HZ7

Notice

- ▶ Maximum permissible pilot pressure: 100 bar
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us. Please note that pressures up to 450 bar can occur at port **G**.
- ▶ At port **X** a leakage flow of maximum 0.3 l/min occurs (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure is to be relieved from port **X** to the reservoir.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 140 to 200

EZ – Two-point electric control

The two-point electric control allows the displacement to be set to either $V_{g \min}$ or $V_{g \max}$ by switching the electric current to a switching solenoid on or off.

Notice

The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 450 bar can occur at port **G**.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

HA – Automatic high-pressure related control

The automatic high-pressure related control adjusts the displacement automatically depending on the operating pressure.

The displacement of the A6VM motor with HA control is $V_{g \min}$ (maximum speed and minimum torque). The control device measures internally the operating pressure at **A** or **B** (no control line required) and upon reaching the set beginning of control, the controller swivels the motor from $V_{g \min}$ to $V_{g \max}$ with increase of operating pressure. The displacement is modulated between $V_{g \min}$ and $V_{g \max}$, thereby depending on load conditions.

HA1, HA2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum speed)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum speed)

Notice

- ▶ For safety reasons, winch drives are not permissible with beginning of control at $V_{g \min}$ (standard for HA).
- ▶ The control oil is internally taken from the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us.
Please note that pressures up to 450 bar can occur at port **G**.
- ▶ The beginning of control and the HA.T3 characteristic curve are influenced by case pressure. An increase in case pressure causes an increase in the beginning of control (see page 7) and thus a parallel shift of the characteristic.
- ▶ At port **X** a leakage flow of maximum 0.3 l/min occurs (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure is to be relieved from port **X** to the reservoir. **Only with HA.T control**

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 55 to 200

HA1,2 with one-sided throttle pin, throttling occurs from $V_{g \min}$ to $V_{g \max}$. (see table)

HA3 and HA3T3 with BVI and throttle pin on both sides, 0.30, symmetrical

▼ Throttle pin overview

Size	55	80	107	140	160	200
Groove size [mm]	0.45	0.45	0.55	0.55	0.55	0.65

Standard for sizes 55 to 200

HA with BVD or BVE counterbalance valve, with throttle screw (see table)

▼ Throttle screw

Diameter [mm]	0.80	0.80	0.80	0.80	0.80	0.80

HA1 with minimum pressure increase, positive control

An operating pressure increase of $\Delta p \leq$ approx. 10 bar results in an increase in displacement from $V_{g \text{ min}}$ towards $V_{g \text{ max}}$.

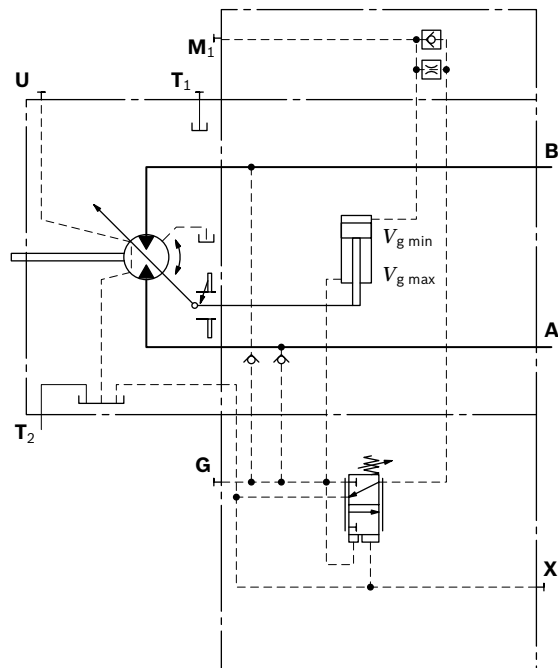

Beginning of control, setting range 80 to 350 bar

Please state the desired beginning of control in plain text when ordering, e.g.: beginning of control at 300 bar.

▼ **Characteristic curve HA1**

▼ **Circuit diagram HA1**

HA2 with pressure increase, positive control

An operating pressure increase of Δp approx. 100 bar results in an increase in displacement from $V_{g \text{ min}}$ to $V_{g \text{ max}}$.

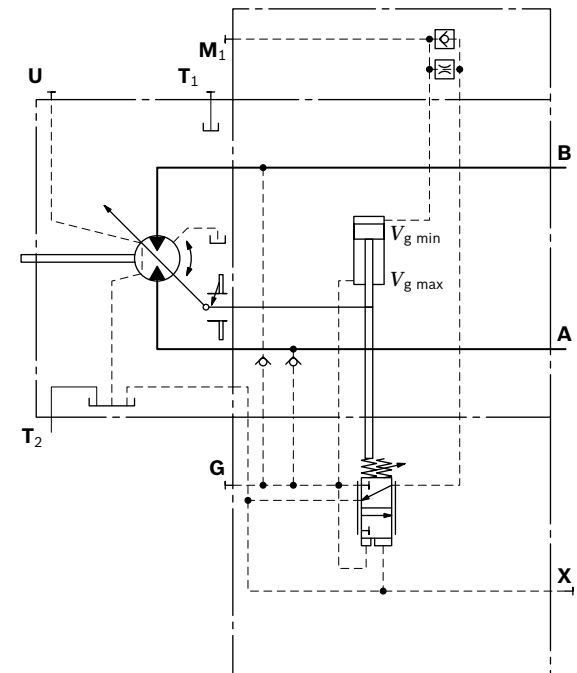

Beginning of control, setting range 80 to 350 bar

Please state the desired beginning of control in plain text when ordering, e.g.: beginning of control at 200 bar.

▼ **Characteristic curve HA2**

▼ **Circuit diagram HA2**

HA.T3 override, hydraulic, remote controlled, proportional

With the HA.T3 control, the beginning of control can be influenced by applying a pilot pressure to port **X**.

For every 1 bar of pilot pressure increase, the beginning of control is reduced by 17 bar.

Beginning of control setting	300 bar	300 bar
Pilot pressure at port X	0 bar	10 bar
Beginning of control at	300 bar	130 bar

Notice

Maximum permissible pilot pressure 100 bar.

▼ **Circuit diagram HA1T3**

▼ **Circuit diagram HA2T3**

HA.U1, HA.U2 electric override, two-point

With the HA.U1 or HA.U2 control, the beginning of control can be overridden by an electric signal to a switching solenoid. When the override solenoid is energized, the variable motor swivels to maximum swivel angle, without intermediate position.

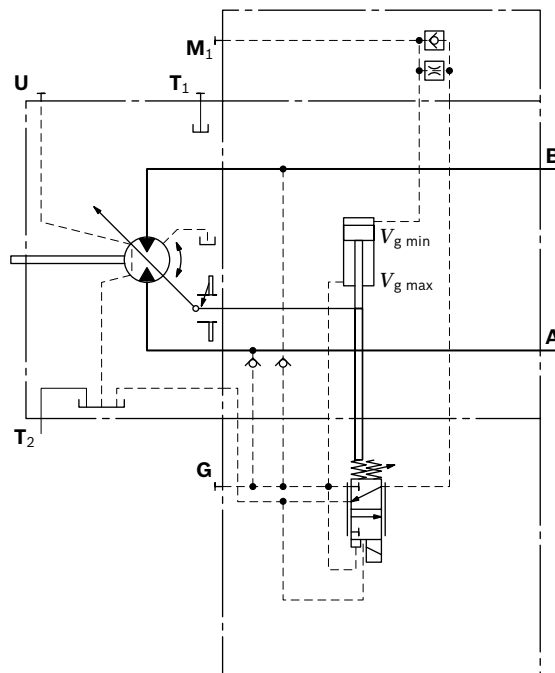

The beginning of control can be set between 80 and 300 bar (specify required setting in plain text when ordering).

Technical data, solenoid with $\varnothing 45$	U1	U2
Voltage	12 V ($\pm 20\%$)	24 V ($\pm 20\%$)
No override	de-energized	de-energized
Position $V_{g \max}$	energized	energized
Nominal resistance (at 20 °C)	4.8 Ω	19.2 Ω
Nominal power	30 W	30 W
Minimum required active current	1.5 A	0.75 A
Duty cycle	100%	100%
Type of protection: see connector version on page 62		

▼ **Circuit diagram HA1U1, HA1U2**

▼ **Circuit diagram HA2U1, HA2U2**

HA.R1, HA.R2 electric override, electric travel direction valve

With the HA.R1 or HA.R2 control, the beginning of control can be overridden by an electric signal to switching solenoid **b**. When the override solenoid is energized, the variable motor swivels to maximum swivel angle, without intermediate position.

The travel direction valve ensures that the preselected pressure side of the hydraulic motor (**A** or **B**) is always connected to the HA control, and thus determines the swivel angle, even if the high-pressure side changes (e.g. -travel drive during a downhill operation). This thereby prevents undesired jerky deceleration and/or braking characteristics.

The travel direction valve (see page 25) is either pressure spring or switched by energizing switching solenoid **a**, depending on the direction of rotation (travel direction).

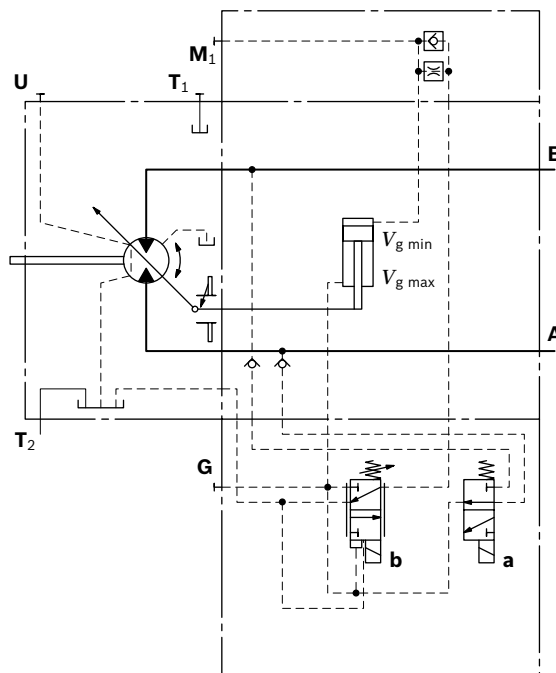

Electric override

Technical data, solenoid b with $\varnothing 45$	R1	R2
Voltage	12 V ($\pm 20\%$)	24 V ($\pm 20\%$)
No override	de-energized	de-energized
Position $V_{g \max}$	energized	energized
Nominal resistance (at 20 °C)	4.8 Ω	19.2 Ω

DA – Automatic speed-related control

The variable motor A6VM with automatic speed-related control, type DA, is intended for use in hydrostatic travel drives in combination with the variable pump A4VG with DA control.

A drive-speed-related pilot pressure signal is generated by the A4VG variable pump, and that signal, together with the operating pressure, regulates the swivel angle of the hydraulic motor.

Increasing pump speed, i.e. increasing pilot pressure, causes the motor to swivel to a smaller displacement (lower torque, higher speed), depending on the operating pressure.

If the operating pressure exceeds the pressure setpoint set on the controller, the variable motor swivels to a larger displacement (higher torque, lower speed).

- ▶ Pressure ratio $p_{St}/p_{HD} = 5/100$

DA closed loop control is only suitable for certain types of drive systems and requires review of the engine and vehicle parameters to ensure that the motor is used correctly and that machine operation is safe and efficient. We recommend that all DA applications be reviewed by a Bosch Rexroth application engineer.

Detailed information is available from our sales organization.

Notice

The beginning of control and the DA characteristic curve are influenced by case pressure. An increase in case pressure causes a decrease in the beginning of control (see page 7) and thus a parallel shift of the characteristic.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 55 to 200

DA with throttle pin on one side, throttling occurs from $V_{g \min}$ to $V_{g \max}$ (see table).

Electric travel direction valve (for DA, HA.R)

Application in travel drives in closed circuits. The travel direction valve of the motor is actuated by an electric signal that also switches the swivel direction of the travel drive pump (e.g. A4VG with DA control valve).

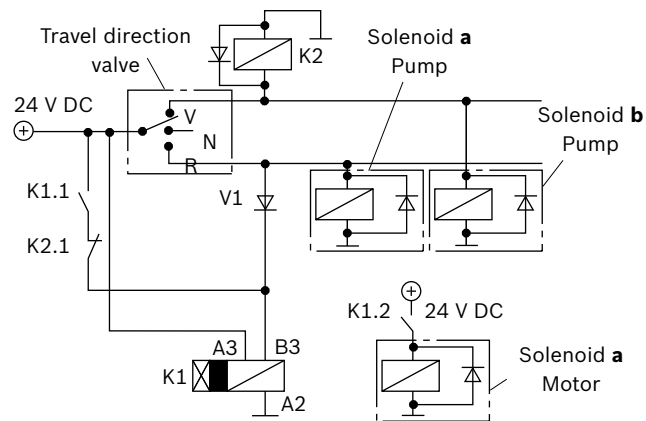

If the pump in the closed circuit is switched to the neutral position or into reverse, the vehicle may experience jerky deceleration or braking, depending on the vehicle weight and current travel speed.

When the travel direction valve, which must be logically coordinated with the pump control, of the pump (e.g. 4/3-way directional valve of the DA-control) is switched to neutral position,

- ▶ the neutral position, the electrical circuitry causes the previous signal on the travel direction valve on the motor to be retained.
- ▶ Reversing, the electrical circuitry causes the travel direction valve of the motor to switch to the other travel direction following a time delay (approx. 0.8 s) with respect to the pump.

As a result, jerky deceleration or braking is prevented in both cases. Circuit diagram, electric travel direction valve

▼ Circuit diagram, electric travel direction valve

Notice

The shown diodes and relays are not included in the scope of delivery of the motor.

Connector for solenoids

DEUTSCH DT04-2P-EP04

Molded connector, 2-pin, without bidirectional suppressor diode

There is the following type of protection with mounted mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

▼ Switching symbol

▼ Mating connector DEUTSCH DT06-2S-EP04

Consisting of	DT designation
1 housing	DT06-2S-EP04
1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery. This can be supplied by Bosch Rexroth on request (material number R902601804).

Notice

- ▶ If necessary, you can change the position of the connector by turning the solenoid.
- ▶ The procedure is defined in the instruction manual.

Neutral position switch

The neutral position switch NLS electronically detects the neutral position of the A6VM, thereby ensuring the torque freedom of the motor. The use of the NLS in a transmission control provides a faster switching cycle in the drive. In addition, the switch reliability is improved and thereby the service life of the drive is increased. Type code, technical data, dimensions and parameters for the connector, plus safety instructions about the sensor can be found in the relevant data sheet 95152 – NLS.

Technical data

Type	NLS	
Recommended operating voltage	5 V	
Maximum voltage	not actuated	32 V
	actuated	11.5 V
Minimum permissible current	0 mA	
Maximum permissible current	10 mA	
Maximum switching cycle number	1 million	
Contact type	normally open contact (open in unactuated state)	
Type of protection (with mating connector plugged)	IP67/IP69K	
Temperature range of sensor (medium and ambient temperature) ¹⁾	-40 °C ... 125 °C	
Temperature range of thread seal ring FKM ¹⁾	-15 °C ... 125 °C	
Pressure resistance	nominal	3 bar
	maximum (momentary peaks)	10 bar ²⁾

Notice

The minimum swivel angle is dependent on the $V_{g \text{ min-Stop}}$

▼ Mating Connector

Consisting of	Material number
1 housing	282080
1 socket contact	282403-1

The mating connector is not included in the scope of delivery. This mating connector can be ordered from AMP.

▼ Dimensions

Version "N" with neutral position switch mounted

Size	Adjustable angle		X [mm]		X1 [mm]
	min.	max.	at min angle	at max angle	
80	0°	2°	144.7	141.4	28.0
107	0°	4°	148.1	140.4	30.0
140	0°	1°	153.1	150.9	30.0
160	0°	0°		153.1	30.0
200	0°	0°		159.1	30.0

- 1) Observe the permissible temperature range of the axial piston motor.
- 2) Observe the permissible viscosity range of the axial piston motor. At oil viscosities $>1800 \text{ mm}^2/\text{s}$, the switch may be unintentionally actuated by case pressure peaks of $> 10 \text{ bar}$.

Flushing and boost pressure valve

The flushing and boost pressure valve is used to remove heat from the hydraulic circuit.

In a closed circuit, it is used for flushing the case and safeguarding the minimum boost pressure.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the leakage. The hydraulic fluid, removed out of the closed circuit must be replaced by cooled hydraulic fluid from the boost pump.

The valve is mounted onto the port plate or integrated (depending on the control type and size).

Cracking pressure of pressure retaining valve

(observe when adjusting the primary valve)

- Sizes 55 to 200, fixed setting 16 bar

Switching pressure of flushing spool Δp

- Sizes 55 to 107 (small flushing valve) 8 ± 1 bar
- Sizes 107 to 200 (medium and large flushing valve) 17.5 ± 1.5 bar

Flushing flow q_v

Orifices can be used to adjust the flushing flows as required. The following information is based on:

$$\Delta p_{ND} = p_{ND} - p_G = 25 \text{ bar and } v = 10 \text{ mm}^2/\text{s}$$

(p_{ND} = low pressure, p_G = case pressure)

Small flushing valve for sizes 55 to 107

1) ISO 6149, ports plugged (in normal operation)
 For notes on tightening torques, see instruction manual.
 The spot face may be deeper than that specified in the standard.

Counterbalance valve BVD and BVE

Function

Counterbalance valves for travel drives and winches operations are designed to reduce the danger of overspeeding and cavitation of axial piston motors in open circuits.

Cavitation occurs if, during braking, when driving downhill or during the load-lowering process, the motor speed is greater than it should be for the given inlet flow and thus the supply pressure collapses.

If the supply pressure falls below the level specified for the relevant counterbalance valve, the counterbalance valve piston moves into the closed position. The cross-sectional area of the counterbalance valve return duct is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor is again as it should be for the given inlet flow.

Notice

- ▶ BBVD available for sizes 55 to 200 and BVE available for sizes 107 to 200.
- ▶ The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set.

Ordering example: A6VM080HA1T30004A/65MWV0N4S 97W0-0 + BVD20F27S/41B-V03K16D0400S12

- ▶ For safety reasons, controls with beginning of control at $V_{g \min}$ (e.g. HA) are not permissible for winch drives!
- ▶ Counterbalance valves must be optimized during prototype commissioning to prevent unacceptable operating conditions and compliance with the specification must be verified.
- ▶ The counterbalance valve does not replace the mechanical service brake and holding brake.
- ▶ Observe the detailed notes on the counterbalance valve in data sheet 95522 – BVD and in data sheet 95525 – BVE!
- ▶ For the design of the brake release valve, we require the following data for the mechanical holding brake:
 - the cracking pressure
 - the volume of the counterbalance spool between minimum travel (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

Mounting of the counterbalance valve

When delivered, the counterbalance valve is fastened to the motor with two tacking screws (transport lock). The tacking screws may not be removed while mounting the working lines! If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be fastened to the motor port plate using the provided tacking screws.

The counterbalance valve is finally mounted to the motor by fitting the SAE flange.

The screws to be used and the instructions for mounting can be found in the instruction manual.

-
- 1) Pressure-relief valve
 - 2) Counterbalance valve, double-acting
 - 3) Counterbalance valve, one-sided

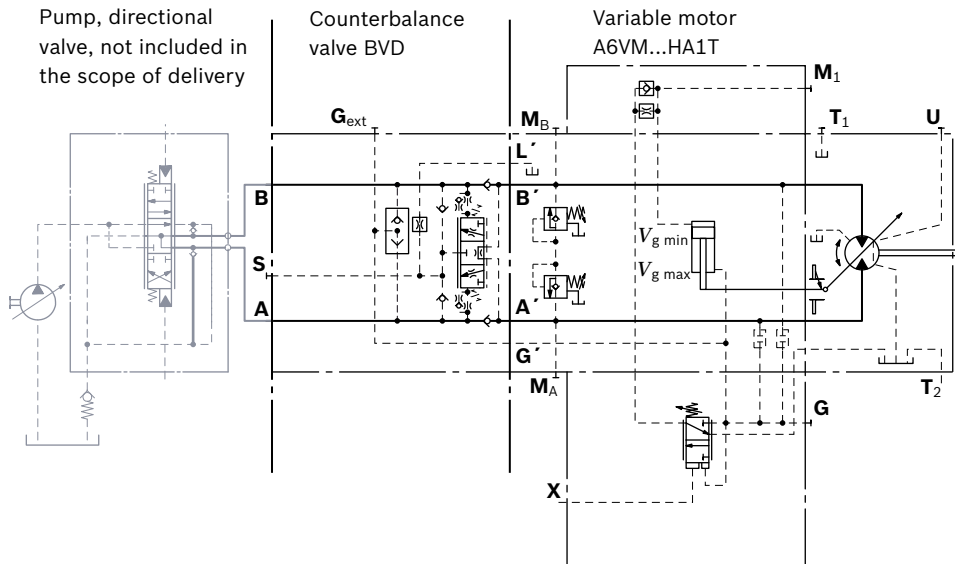

Counterbalance valve for travel drive BVD...F

Application option

- ▶ Travel drive for wheeled excavators (BVD and BVE)

S	Infeed	BVD20	DIN 3852 ⁴⁾	M22 × 1.5; 14 deep	30	X	
		BVD25, BVE25	DIN 3852 ⁴⁾	M27 × 2; 16 deep	30	X	
B _r	Brake release, reduced high pressure	L	7	DIN 3852 ⁴⁾	M12 × 1.5; 12.5 deep	30	O
			8	DIN 3852 ⁴⁾	M12 × 1.5; 12 deep	30	O
G _{ext}	Brake release, high pressure	S		DIN 3852 ⁴⁾	M12 × 1.5; 12.5 deep	420	X
M _A , M _B	Pressure measurement A and B			ISO 6149 ⁴⁾	M18 × 1.5; 14.5 deep	420	X

1) At the mounting version for the controls HP5, HP6 and EP5, EP6, the cast-in port designations **A** and **B** on the BVD counterbalance valve do not correspond with the port designation of the A6VM motor..

The designation of the ports on the installation drawing of the motor is binding!

2) For notes on tightening torques, see instruction manual

3) Depending on the application, momentary pressure peaks can occur. Keep this in mind when selecting measuring devices and fittings.

4) The countersink can be deeper than as specified in the standard.

5) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

Speed sensor

Version A6VM...U ("prepared for speed sensor", i.e. without sensor) is equipped with a spline on the rotary group.

A signal proportional to motor speed can be generated with the fitted DSA/DSM speed sensor. The DSA/DSM sensor registers the speed and direction of rotation.

Ordering code, technical data, dimensions and details on the connector, plus safety instructions about the sensor can be found in the relevant data sheet (95132 – DSM, 95133 – DSA).

The sensor is mounted on the port provided for this purpose with a mounting bolt. On deliveries without sensor, the port is plugged with a pressure-resistant cover.

We recommend ordering the A6VM variable motor complete with mounted sensor.

Installation instructions

General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the fluid from the axial piston unit may drain back to the reservoir via the hydraulic lines.

Particularly in the installation position “drive shaft upwards” filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The leakage in the motor housing must be directed to the reservoir via the highest available drain port (**T₁**, **T₂**).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the maximum permissible case pressure of all connected units is not exceeded at any operational conditions. If this is not possible, separate drain lines must be laid.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Notice

In certain installation positions, an influence on the control characteristic can be expected. Gravity, dead weight and case pressure can cause minor characteristic shifts and changes in response time.

Key	
F	Filling / air bleeding
U	Bearing flushing / air bleed port
T₁, T₂	Drain port
h_{t min}	Minimum required immersion depth (200 mm)
h_{min}	Minimum required spacing to reservoir bottom (100 mm)

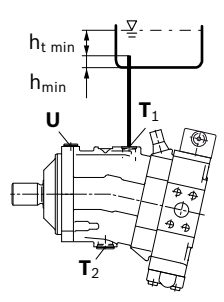

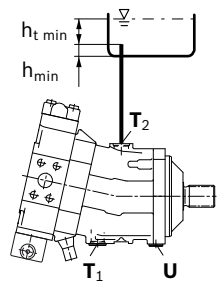

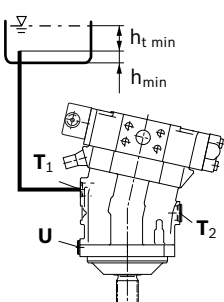

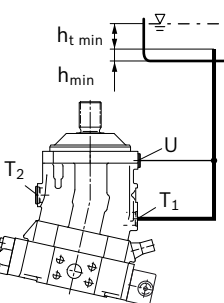

Installation position

See examples **1** to **8** below.

Additional installation positions are available upon request.
Recommended installation position: **1** and **2**

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

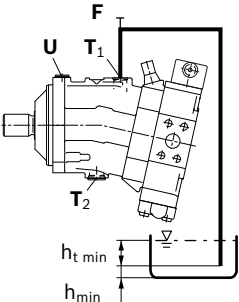

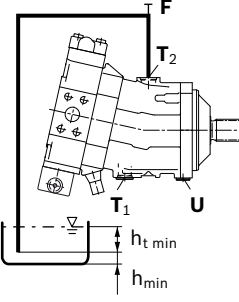

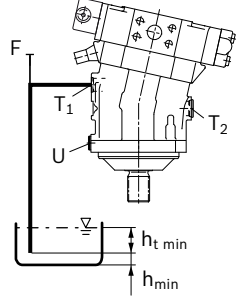

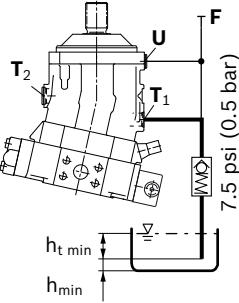

Installation position	Air bleed	Filling
1 		T₁
2 		T₂
3 		T₁
4 	U	T₁

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Recommendation for installation position 8 (drive shaft upward):

A check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the motor housing.

Installation position	Air bleed	Filling
<p>5</p> 	U (F)	T₁ (F)
<p>6</p> 	F	T₂ (F)
<p>7</p> 	F	T₁ (F)
<p>8</p> 	U	T₁ (F)

Notice

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

Project planning notes

- ▶ The motor A6VE is designed to be used in open and closed circuits.
- ▶ The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified skilled personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes contained herein must be observed.
- ▶ For safety reasons, controls with beginning of control at $V_{g \text{ min}}$ (e.g. HA) are not permissible for winch drives, e.g. anchor winches.
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or the instruction manual.
- ▶ Not all versions of the product are approved for use in a safety function according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. When a direct current is applied, solenoids do not cause electromagnetic interference nor is their operation impaired by electromagnetic interference.
Other behavior can result when a modulated direct current (e.g. PWM signal) is applied. Potential electromagnetic interference for persons (e.g. persons with a pacemaker) and other components must be tested by the machine manufacturer.
- ▶ Please note the details regarding the tightening torques of port threads and other threaded joints in the instruction manual.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports are only intended to accommodate hydraulic lines.

Safety instructions

- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve pistons) can, under certain circumstances get stuck in position as a result of contamination (e.g. impure hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filter) will not rule out a fault but merely reduce the risk.
The machine/system manufacturer must test whether remedial measures are needed on the machine for the application concerned in order to set the consumer being driven to a safe position (e.g. safe stop) and if necessary to ensure it is properly implemented.
- ▶ Moving parts in high-pressure relief valves may in certain circumstances become stuck in an undefined position due to contamination (e.g. contaminated hydraulic fluid). This can result in restriction or loss of the load holding function in lifting winches.
The machine/system manufacturer must check whether additional measures are required on the machine for the relevant application in order to keep the load in a safe position and ensure they are properly implemented.
- ▶ When using the axial piston motor in winch drives, make certain that the technical limit values are not exceeded under all operating conditions. If the axial piston motor is extremely overloaded (e.g. if the maximum permissible rotational speeds are exceeded during weighing of the anchor while the ship is in motion), the rotary group may be damaged and, in the worst case, the axial piston motor may burst. The machine manufacturer / system manufacturer is to undertake additional measures, up to and including encapsulation.

Axial piston variable motor A6VM series 71

- ▶ All-purpose high pressure motor
- ▶ Sizes 60 to 215
- ▶ Nominal pressure 450 bar
- ▶ Maximum pressure 500 bar
- ▶ Open and closed circuits

Features

- ▶ Robust motor with long service life
- ▶ Approved for very high rotational speeds
- ▶ High starting efficiency
- ▶ Excellent slow-running characteristics
- ▶ Variety of controls
- ▶ High control range (can be swiveled to zero)
- ▶ High torque
- ▶ Optionally with flushing and boost-pressure valve mounted
- ▶ Optionally with mounted high-pressure counterbalance valve
- ▶ Bent-axis design

Hydraulic fluids

The variable motor A6VM is designed for operation with mineral oil HLP according to DIN 51524.

Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally friendly hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)
- ▶ 90225: Axial piston units for operation with water-free and water-containing fire-resistant hydraulic fluids (HFDR, HFDU, HFB, HFC).

The variable motor A6VM is not suitable for operation with HFA fluids. If operating with HFB-, HFC- and HFD or environmentally acceptable hydraulic fluids, the limitations regarding technical data or other seals must be observed.

Notes on selection of hydraulic fluid

The hydraulic fluid should be selected such that the operating viscosity in the operating temperature range is within the optimum range (v_{opt} see selection diagram).

Notice

At no point of the component may the temperature be higher than 115 °C. The temperature difference specified in the table is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend the use of a flushing and boost-pressure valve (see page 64).

Viscosity and temperature of hydraulic fluids

	Viscosity	Temperature	Comment
Cold start	$v_{max} \leq 1600 \text{ mm}^2/\text{s}$	$\theta_{St} \geq -40 \text{ °C}$	$t \leq 3 \text{ min}$, $n \leq 1000 \text{ rpm}$, without load $p \leq 50 \text{ bar}$
Permissible temperature difference		$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid in the system
Warm-up phase	$v = 1600 \text{ bis } 400 \text{ mm}^2/\text{s}$	$\theta = -40 \text{ °C bis } -25 \text{ °C}$	at $p \leq 0.7 \times p_{nom}$, $n \leq 0.5 \times n_{nom}$ and $t \leq 15 \text{ min}$
Continuous operation	$v = 400 \text{ bis } 10 \text{ mm}^2/\text{s}$	$\theta = -25 \text{ °C bis } +103 \text{ °C}$	This corresponds, for example on the VG 46, to a temperature range of +5 °C to +85 °C (see selection diagram)
	$v_{opt} = 36 \text{ to } 16 \text{ mm}^2/\text{s}$		measured at port T Note the permissible temperature range of the shaft seal ($\Delta T = \text{approx. } 12 \text{ K}$ between the bearing/shaft seal and port T) Range of optimum operating viscosity and efficiency
Short-term operation	$v_{min} \geq 7 \text{ mm}^2/\text{s}$		$t < 3 \text{ min}$, $p < 0.3 \times p_{nom}$

Selection diagram

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At very high hydraulic fluid temperatures (90 °C to maximum 103 °C, measured at port **T**), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

Influence of case pressure on beginning of control

An increase in case pressure affects the beginning of control of the variable motor when using the following control options:

- ▶ HP, HA.T3: increase
- ▶ DA: decrease

With the following settings, an increase in case pressure will have no effect on the beginning of control:

HA.R and HA.U, EP, HA

The factory setting of the beginning of control is made at $p_{abs} = 2$ bar case pressure.

Flow direction

Direction of rotation, viewed on drive shaft	
cw	ccw
A to B	B to A

Shaft seal

Permissible pressure loading

The service life of the shaft seal will be influenced by the speed of the axial piston unit and the leakage pressure in the housing (case pressure). Momentary pressure spikes ($t < 0.1$ s) of up to 10 bar are permitted. Case pressures of a continuous 2 bar maximum are permitted to be able to utilize the entire speed range. Higher case pressures are permissible at lower rotational speeds (see diagram). The service life of the shaft seal decreases with increasing frequency of pressure spikes and increasing mean differential pressure.

The case pressure must be equal to or higher than the ambient pressure.

The FKM shaft seal may be used for leakage temperatures from -25 °C to +115 °C. For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

Operating pressure range

Pressure at service line port A or B		Definition
Nominal pressure p_{nom}	450 bar	The nominal pressure corresponds to the maximum design pressure.
Maximum pressure p_{max}	500 bar	The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.
Single operating period	10 s	
Total operating period	300 h	
Minimum pressure (high-pressure side)	25 bar absolute	Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.
Minimum pressure – pump operating mode (inlet)	See the diagram below	To prevent damage to the axial piston motor in pump operating mode (change of high-pressure side with unchanged direction of rotation, e.g. when braking), a minimum pressure must be guaranteed at the service line port (inlet). This minimum pressure is dependent on the speed and displacement of the axial piston unit (see characteristic curve)
Summation pressure p_{Su} (pressure A + pressure B)	700 bar	The summation pressure is the sum of the pressures at both service line ports (A and B)
Rate of pressure change $R_{A\ max}$		Maximum permissible rate of pressure rise and reduction during a pressure change over the entire pressure range.
With integrated pressure-relief valve	9000 bar/s	
Without pressure-relief valve	16000 bar/s	

▼ Rate of pressure change $R_{A\ max}$

▼ Minimum pressure – pump operating mode (inlet)

▼ Pressure definition

This diagram is valid only for the optimum viscosity range from $\nu_{opt} = 36$ to $16\text{ mm}^2/\text{s}$.

Please contact us if these conditions cannot be satisfied.

Notice

Working pressure range valid when using hydraulic fluids based on mineral oils. Values for other hydraulic fluids, please contact us.

Total operating period = $t_1 + t_2 + \dots + t_n$

Speed range

The minimum rotational speed n_{min} is not limited. For applications with requirements on the evenness of the rotation at low rotational speeds, please contact us.

Notice

- Theoretical values, without efficiency and tolerances; values rounded
- Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, such as speed variation, reduced angular acceleration as a function of the frequency and the permissible angular acceleration at start (lower than the maximum angular acceleration) can be found in data sheet 90261.

▼ Permissible displacement in relation to speed

Determining the operating characteristics

Inlet flow	$q_v = \frac{V_g \times n}{1000 \times \eta_v}$	[l/min]
------------	---	---------

Rotational speed	$n = \frac{q_v \times 1000 \times \eta_v}{V_g}$	[rpm]
------------------	---	-------

Torque	$T = \frac{V_g \times \Delta p \times \eta_{\text{mh}}}{20 \times \pi}$	[Nm]
--------	---	------

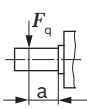

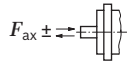

Power	$P = \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p \times \eta_t}{600}$	[kW]
-------	---	------

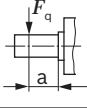

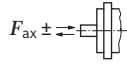

Key

V_g	=	Displacement per revolution [cm ³]
Δp	=	Differential pressure [bar]
n	=	Rotational speed [rpm]
η_v	=	Volumetric efficiency
η_{mh}	=	Mechanical-hydraulic efficiency
η_t	=	Total efficiency ($\eta_t = \eta_v \cdot \eta_{\text{mh}}$)

- The values are valid:
 - For the optimum viscosity range from $\nu_{\text{opt}} = 36$ to 16 mm²/s
 - with hydraulic fluid on the basis of mineral oil
- Note inlet flow limitation due to counterbalance valve (see page 66).
- Torque without radial force, With radial force see page 10.
- Values in this range on request

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

▼ **Toothed gear output drive**

- 1 Direction of rotation " counter-clockwise", pressure at port B
- 2 Direction of rotation "clockwise", pressure at port A
- 3 Bidirectional direction of rotation

Notice

- ▶ The values given are maximum values and do not apply to continuous operation.
- ▶ The permissible axial force in direction $-F_{ax}$ is to be avoided as the lifetime of the bearing is reduced.
- ▶ Special requirements apply in the case of belt drives. Please contact us.

Drucklufttechnik GmbH, E-Mail: info@drucklufttechnik.de

HP – Proportional hydraulic control

The proportional hydraulic control provides infinite adjustment of the displacement. Control is proportional to the pilot pressure applied to port **X**.

HP1, HP2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible speed at minimum pilot pressure)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum speed at maximum pilot pressure)

HP5, HP6 negative control

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum speed at minimum pilot pressure)
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible speed at maximum pilot pressure)

Notice

- ▶ Maximum permissible pilot pressure: $p_{St} = 100$ bar
- ▶ The control oil is internally taken from the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 500 bar can occur at port **G**.

- ▶ Please state the desired beginning of control in plain text when ordering, e.g.: beginning of control at 10 bar.
- ▶ The beginning of control and the HP characteristic curve are influenced by the case pressure. An increase in case pressure causes an increase in the beginning of control (see page 7) and thus a parallel shift of the characteristic.
- ▶ A leakage flow of maximum 0.3 l/min can occur at port **X** due to internal leakage (working pressure > pilot pressure). The control is to be suitably configured to avoid an independent build-up of pilot pressure.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 60 to 215

HP without damping.

HP.D with throttle pin on both sides, symmetrical (see table)

Optional for sizes 60 to 215

HP with throttle pin on both sides, symmetrical (see table)

▼ Throttle pin overview

Size	60	85	115	150	170	215
Groove size [mm]	0.45	0.45	0.55	0.55	0.55	0.65

HP1, HP5 pilot pressure increase $\Delta p_{St} = 10$ bar

HP1 positive control

A pilot pressure increase of 10 bar at port **X** results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

HP5 negative control

A pilot pressure increase of 10 bar at port **X** results in a decrease in displacement from $V_{g \max}$ to $V_{g \min}$.

- ▶ Beginning of control, setting range 2 to 20 bar
- ▶ Standard setting: beginning of control at 3 bar (end of control at 13 bar)

▼ Characteristic curve

HP2, HP6 pilot pressure increase $\Delta p_{St} = 25$ bar

HP2 positive control

A pilot pressure increase of 25 bar at port **X** results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

HP6 negative control

A pilot pressure increase of 25 bar at port **X** results in a decrease in displacement from $V_{g \max}$ to $V_{g \min}$.

- ▶ Beginning of control, setting range 5 to 35 bar
- ▶ Standard setting: beginning of control at 10 bar (end of control at 35 bar)

▼ **Characteristic curve**

▼ **Circuit diagram HP5, HP6 (negative control)**

▼ **Circuit diagram HP1, HP2 (positive control)**

HP5D1, HP6D1 Pressure control, fixed setting

The pressure control overrides the HP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger displacement. The increase in the displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant. Setting range of the pressure control valve 80 to 450 bar

▼ **Circuit diagram HP5D1, HP6D1 (negative control)**

EP – Proportional electric control

The proportional electric control, type EP, provides infinite adjustment of the displacement, proportional to the control current applied to the solenoid.

EP1, EP2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible speed at minimum control current)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum speed at maximum control current)

EP5, EP6 negative control

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum speed at minimum control current)
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible speed at maximum control current)

▼ Characteristic curve

Notice

The control oil is internally taken from the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 500 bar can occur at port **G**.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 60 to 215

EP without damping.

EP.D with throttle pin on both sides, symmetrical (see table)

Optional for sizes 60 to 215

EP with throttle pin on both sides, symmetrical (see table)

Various BODAS controllers with application software and amplifiers are available for controlling the proportional solenoids.

¹⁾ Minimum required oscillation range of the control current $\Delta I_{p,p}$ (peak to peak) within the respective control range (start of control to end of control)

▼ Circuit diagram EP1, EP2 (positive control)

▼ Circuit diagram EP5, EP6 (negativ control)

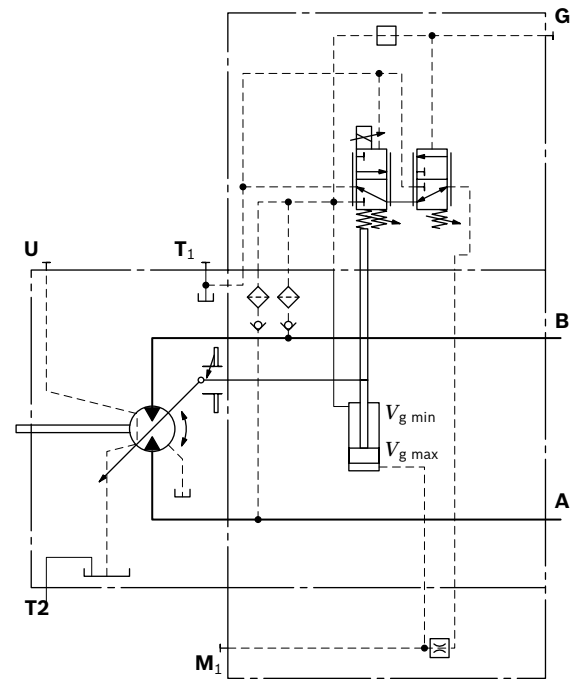

EP5D1, EP6D1 Pressure control, fixed setting

The pressure control overrides the EP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger displacement.

The increase in the displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve 80 to 450 bar

▼ Circuit diagram EP5D1, EP6D1 (negativ control)

HZ – Two-point hydraulic control

The two-point hydraulic control allows the displacement to be set to either $V_{g\ min}$ or $V_{g\ max}$ by switching the pilot pressure at port **X** on or off.

HZ5, HZ7 negative control

- ▶ Position at $V_{g\ max}$ (without pilot pressure, maximum torque, minimum speed)
- ▶ Position at $V_{g\ min}$ (with pilot pressure > 15 bar activated, minimum torque, maximum permissible speed)

▼ Characteristic curve HZ5, HZ7

Notice

- ▶ Maximum permissible pilot pressure: 100 bar
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us. Please note that pressures up to 500 bar can occur at port **G**.
- ▶ At port **X** a leakage flow of maximum 0.3 l/min occurs (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure is to be relieved from port **X** to the reservoir.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 150 to 215

HZ5 with throttle pin on both sides, symmetrical (see table)

EZ – Two-point electric control

The two-point electric control allows the displacement to be set to either $V_{g \min}$ or $V_{g \max}$ by switching the electric current to a switching solenoid on or off.

Notice

The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 500 bar can occur at port **G**.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

HA – Automatic high-pressure related control

The automatic high-pressure related control adjusts the displacement automatically depending on the operating pressure.

The displacement of the A6VM motor with HA control is $V_{g\ min}$ (maximum speed and minimum torque). The control device measures internally the operating pressure at **A** or **B** (no control line required) and upon reaching the set beginning of control, the controller swivels the motor from $V_{g\ min}$ to $V_{g\ max}$ with increase of operating pressure. The displacement is modulated between $V_{g\ min}$ and $V_{g\ max}$, thereby depending on load conditions.

HA1, HA2 positive control

- ▶ Beginning of control at $V_{g\ min}$ (minimum torque, maximum speed)
- ▶ End of control at $V_{g\ max}$ (maximum torque, minimum speed)

Notice

- ▶ For safety reasons, winch drives are not permissible with beginning of control at $V_{g\ min}$ (standard for HA).
- ▶ The control oil is internally taken from the high pressure side of the motor (**A** or **B**). For reliable control, an operating pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** via an external check valve. For lower pressures, please contact us.
Please note that pressures up to 500 bar can occur at port **G**.
- ▶ The beginning of control and the HA.T3 characteristic curve are influenced by case pressure. An increase in case pressure causes an increase in the beginning of control (see page 7) and thus a parallel shift of the characteristic.
- ▶ At port **X** a leakage flow of maximum 0.3 l/min occurs (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure is to be relieved from port **X** to the reservoir. **Only with HA.T control.**

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 60 to 215

HA1,2 with one-sided throttle pin, throttling occurs from $V_{g\ min}$ to $V_{g\ max}$. (see table)

HA3 and HA3T3 with BVI and throttle pin on both sides, 0.30, symmetrical

Standard for sizes 60 to 215

HA with BVD or BVE counterbalance valve, with throttle screw (see table)

▼ Throttle screw

Size	60	85	115	150	170	215
Diameter [mm]	0.80	0.80	0.80	0.80	0.80	0.80

HA1 with minimum pressure increase, positive control

An operating pressure increase of $\Delta p \leq$ approx. 10 bar results in an increase in displacement from $V_{g \min}$ towards $V_{g \max}$.

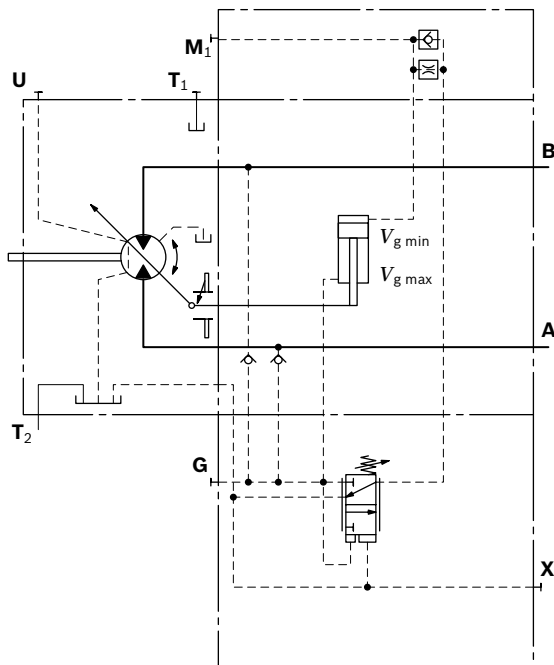

Beginning of control, setting range 80 to 350 bar

Please state the desired beginning of control in plain text when ordering, e.g.: beginning of control at 300 bar.

▼ **Characteristic curve HA1**

▼ **Circuit diagram HA1**

HA2 with pressure increase, positive control

An operating pressure increase of Δp approx. 100 bar results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

Beginning of control, setting range 80 to 350 bar

Please state the desired beginning of control in plain text when ordering, e.g.: beginning of control at 200 bar

▼ **Characteristic curve HA2**

▼ **Circuit diagram HA2**

HA.T3 override, hydraulic, remote controlled, proportional

With the HA.T3 control, the beginning of control can be influenced by applying a pilot pressure to port **X**. For each 1 bar of pilot pressure increase, the beginning of control is reduced by 17 bar.

Beginning of control setting	300 bar	300 bar
Pilot pressure at port X	0 bar	10 bar
Beginning of control at	300 bar	130 bar

Notice

Maximum permissible pilot pressure 100 bar.

▼ **Circuit diagram HA2T3**

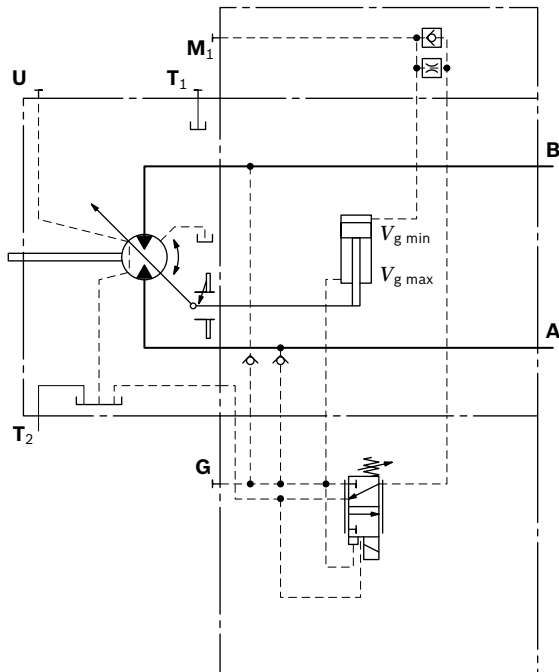

HA.U1, HA.U2 electric override, two-point

With the HA.U1 or HA.U2 control, the beginning of control can be overridden by an electric signal to a switching solenoid. When the override solenoid is energized, the variable motor swivels to maximum swivel angle, without intermediate position.

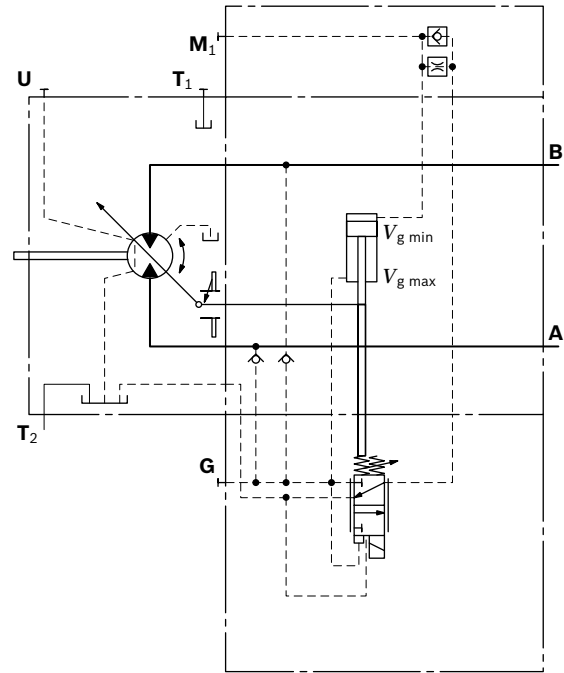

The beginning of control can be set between 80 and 300 bar (specify required setting in plain text when ordering).

Technical data, solenoid with $\varnothing 45$	U1	U2
Voltage	12 V ($\pm 20\%$)	24 V ($\pm 20\%$)
No override	de-energized	de-energized
Position $V_{g \max}$	energized	energized

Type of protection: see connector version on page 62		

▼ **Circuit diagram HA1U1, HA1U2**

▼ **Circuit diagram HA2U1, HA2U2**

HA.R1, HA.R2 electric override, electric travel direction valve

With the HA.R1 or HA.R2 control, the beginning of control can be overridden by an electric signal to switching solenoid **b**. When the override solenoid is energized, the variable motor swivels to maximum swivel angle, without intermediate position.

The travel direction valve ensures that the preselected pressure side of the hydraulic motor (**A** or **B**) is always connected to the HA control, and thus determines the swivel angle, even if the high-pressure side changes (e.g. -travel drive during a downhill operation). This thereby prevents undesired jerky deceleration and/or braking characteristics.

The travel direction valve (see page 25) is either pressure spring or switched by energizing switching solenoid **a**, depending on the direction of rotation (travel direction).

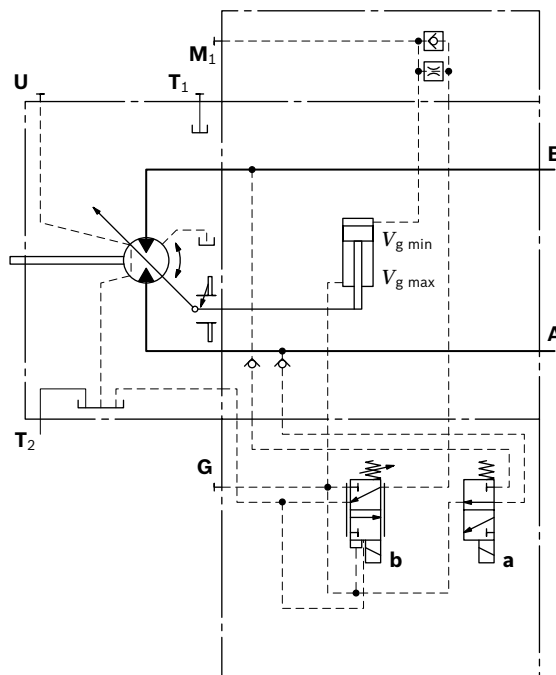

Electric override

Technical data, solenoid b with ø45	R1	R2
Voltage	12 V (±20 %)	24 V (±20 %)
No override	de-energized	de-energized
Position $V_{g \max}$	energized	energized

DA – Automatic speed-related control

The variable motor A6VM with automatic speed-related control, type DA, is intended for use in hydrostatic travel drives in combination with the variable pump A4VG with DA control.

A drive-speed-related pilot pressure signal is generated by the A4VG variable pump, and that signal, together with the operating pressure, regulates the swivel angle of the hydraulic motor.

Increasing pump speed, i.e. increasing pilot pressure, causes the motor to swivel to a smaller displacement (lower torque, higher speed), depending on the operating pressure.

If the operating pressure exceeds the pressure setpoint set on the controller, the variable motor swivels to a larger displacement (higher torque, lower speed).

- ▶ Pressure ratio $p_{St}/p_{HD} = 5/100$

DA closed loop control is only suitable for certain types of drive systems and requires review of the engine and vehicle parameters to ensure that the motor is used correctly and that machine operation is safe and efficient. We recommend that all DA applications be reviewed by a Bosch Rexroth application engineer.

Detailed information is available from our sales organization.

Notice

The beginning of control and the DA characteristic curve are influenced by case pressure. An increase in case pressure causes a decrease in the beginning of control (see page 7) and thus a parallel shift of the characteristic.

Response time damping

The response time damping impacts the swivel behavior of the motor and consequently the machine response speed.

Standard for sizes 60 to 215

DA with throttle pin on one side, throttling occurs from $V_{g \min}$ to $V_{g \max}$ (see table).

Groove size [mm]	0.45	0.45	0.55	0.55	0.55	0.65

DA0 hydraulic travel direction valve, negative control

Depending on the direction of rotation (travel direction), the travel direction valve is switched by using pilot pressures connections X_1 or X_2 .

Direction of rotation	Operating pressure in	Pilot pressure in
cw	A	X_1
ccw	B	X_2

▼ Circuit diagram DA0

DA1, DA2 electric travel direction valve + electric $V_{g \max}$ circuit, negative control

The travel direction valve is either pressure spring offset or switched by energizing switching solenoid **a**, depending on the direction of rotation (travel direction).

When the switching solenoid **b** is energized, the DA control is overridden and the motor swivels to maximum displacement (high torque, lower speed) (electric $V_{g \max}$ -circuit).

▼ Circuit diagram DA1, DA2

Electric travel direction valve (for DA, HA.R)

Application in travel drives in closed circuits. The travel direction valve of the motor is actuated by an electric signal that also switches the swivel direction of the travel drive pump (e.g. A4VG with DA control valve).

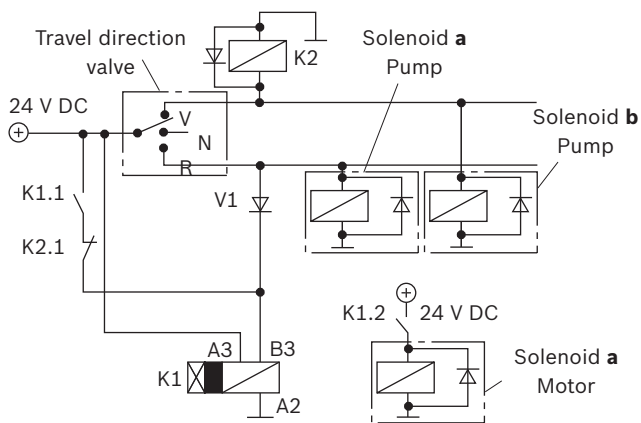

If the pump in the closed circuit is switched to the neutral position or into reverse, the vehicle may experience jerky deceleration or braking, depending on the vehicle's mass and current travel speed.

When the travel direction valve of the pump (e.g. 4/3-directional valve of the DA-control) is switched to

- ▶ the neutral position, the electric circuitry causes the previous signal on the travel direction valve on the motor to be retained.
- ▶ Reversing, the travel direction valve causes the travel direction valve of the motor to switch to the other travel direction following a time delay (approx. 0.8 s) with respect to the pump.

As a result, jerky deceleration or braking is prevented in both cases.

Connector for solenoids

DEUTSCH DT04-2P-EP04

Molded connector, 2-pin, without bidirectional suppressor diode

There is the following type of protection with mounted mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

▼ Circuit symbol

▼ Mating connector DEUTSCH DT06-2S-EP04

Consisting of	DT designation
1 housing	DT06-2S-EP04
1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery. This can be supplied by Bosch Rexroth on request (material number R902601804).

Notice

- ▶ If necessary, you can change the position of the connector by turning the solenoid.
- ▶ The procedure is defined in the instruction manual.

Neutral position switch

The neutral position switch NLS electronically detects the neutral position of the A6VM, thereby ensuring the torque freedom of the motor. The use of the NLS in a transmission control provides a faster switching cycle in the drive. In addition, the switch reliability is improved and thereby the service life of the drive is increased. Type code, technical data, dimensions and parameters for the connector, plus safety instructions about the sensor can be found in the relevant data sheet 95152 – NLS.

Technical data

Type	NLS	
Recommended operating voltage	5 V	
Maximum voltage	not actuated	32 V
	actuated	11.5 V
Minimum permissible current	0 mA	
Maximum permissible current	10 mA	
Maximum switching cycle number	1 million	
Contact type	normally open contact (open in unactuated state)	
Type of protection (with mating connector plugged)	IP67/IP69K	
Temperature range of sensor (medium and ambient temperature) ¹⁾	-40 °C ... 125 °C	
Temperature range of thread seal ring FKM ¹⁾	-15 °C ... 125 °C	
Pressure resistance	nominal	3 bar
	maximum (momentary peaks)	10 bar ²⁾

Notice

The minimum swivel angle is dependent on the $V_{g \text{ min-Stop}}$

▼ Mating Connector

Consisting of	Material number
1 housing	282080
1 socket contact	282403-1

The mating connector is not included in the scope of delivery. This mating connector can be ordered from AMP.

▼ Dimensions

Version "N" with neutral position switch mounted

Size	Adjustable angle		X [mm]		X1 [mm]
	min.	max.	at min angle	at max angle	
85	0°	2°	144.7	141.4	28.0
115	0°	4°	148.1	140.4	30.0
150	0°	1°	153.1	150.9	30.0
170	0°	0°		153.1	30.0
215	0°	0°		159.1	30.0

1) Observe the permissible temperature range of the axial piston motor.

2) Observe the permissible viscosity range of the axial piston motor. At oil viscosities >1800 mm²/s, the switch may be unintentionally actuated by case pressure peaks of > 10 bar.

Flushing and boost pressure valve

The flushing and boost pressure valve is used to remove heat from the hydraulic circuit.

In a closed circuit, it is used for flushing the case and safeguarding the minimum boost pressure.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the leakage. The hydraulic fluid, removed out of the closed circuit must be replaced by cooled hydraulic fluid from the boost pump.

The valve is mounted onto the port plate or integrated (depending on the control type and size).

Cracking pressure of pressure retaining valve

(observe when adjusting the primary valve)

- Sizes 60 to 215, fixed setting 16 bar

Switching pressure of flushing spool Δp

- Sizes 60 to 115 (small flushing valve) 8 ± 1 bar
- Sizes 115 to 215 (medium and large flushing valve) 17.5 ± 1.5 bar

Flushing flow q_v

Orifices can be used to adjust the flushing flows as required. The following information is based on:

$$\Delta p_{ND} = p_{ND} - p_G = 25 \text{ bar and } v = 10 \text{ mm}^2/\text{s}$$

(p_{ND} = low pressure, p_G = case pressure)

Small flushing valve for sizes 60 to 115

Material number of orifice	\varnothing [mm]	q_v [l/min]	Code

1) ISO 6149, ports plugged (in normal operation)
 For notes on tightening torques, see instruction manual.
 The spot face may be deeper than that specified in the standard.

Counterbalance valve BVD and BVE

Function

Counterbalance valves for travel drives and winches operations are designed to reduce the danger of overspeeding and cavitation of axial piston motors in open circuits. Cavitation occurs if, during braking, when driving downhill or during the load-lowering process, the motor speed is greater than it should be for the given inlet flow and thus the supply pressure collapses.

If the supply pressure falls below the level specified for the relevant counterbalance valve, the counterbalance valve piston moves into the closed position.

The cross-sectional area of the counterbalance valve return duct is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor is again as it should be for the given inlet flow.

Notice

- ▶ BVD available for sizes 60 to 215 and BVE available for sizes 115 to 215.
- ▶ The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set.
Ordering example: A6VM085HA1T30004A/71MWW0N4S97W0-0 + BVD20F27S/41B-V03K16D0400S12

- ▶ For safety reasons, controls with beginning of control at $V_{g \min}$ (e.g. HA) are not permissible for winch drives!
- ▶ Counterbalance valves must be optimized during prototype commissioning to prevent unacceptable operating conditions and compliance with the specification must be verified.
- ▶ The counterbalance valve does not replace the mechanical service brake and holding brake.
- ▶ Observe the detailed notes on the counterbalance valve in data sheet 95522 – BVD and in data sheet 95525 – BVE!
- ▶ For the design of the brake release valve, we require the following data for the mechanical holding brake:
 - the cracking pressure
 - the volume of the counterbalance spool between minimum travel (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

Mounting of the counterbalance valve

When delivered, the counterbalance valve is fastened to the motor with two tacking screws (transport lock). The tacking screws may not be removed while mounting the working lines! If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be fastened to the motor port plate using the provided tacking screws.

The counterbalance valve is finally mounted to the motor by fitting the SAE flange

The screws to be used and the instructions for mounting can be found in the instruction manual.

-
- 1) Pressure-relief valve
 - 2) Counterbalance valve, double-acting
 - 3) Counterbalance valve, one-sided

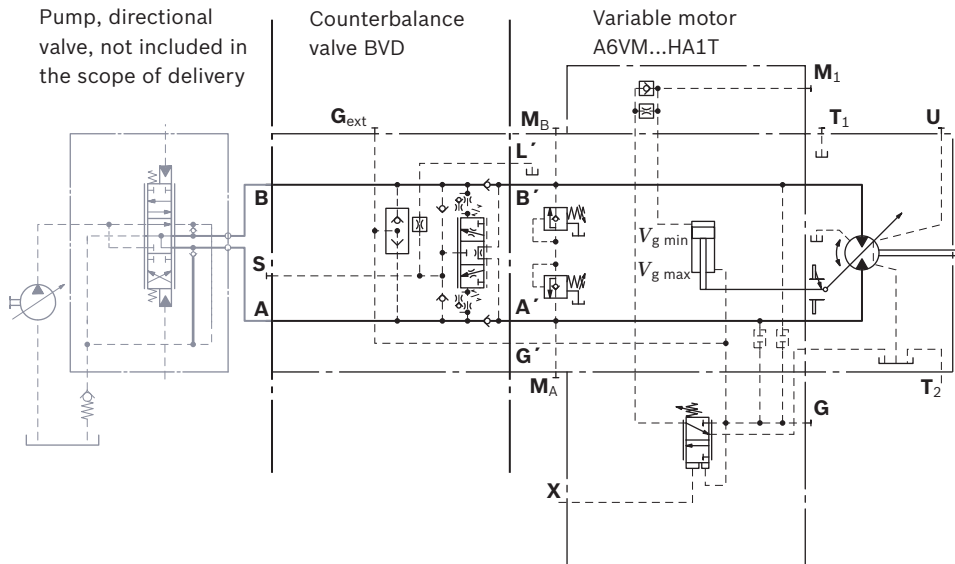

Counterbalance valve for travel drive BVD...F

Application option

- ▶ Travel drive for wheeled excavators (BVD and BVE)

▼ Example circuit diagram for travel drive on wheeled excavators

			8	DIN 3852 ⁴⁾	M12 × 1.5; 12 deep	30	O
G _{ext}	Brake release, high pressure	S		DIN 3852 ⁴⁾	M12 × 1.5; 12.5 deep	420	X
M _A , M _B	Pressure measurement A and B			ISO 6149 ⁴⁾	M18 × 1.5; 14.5 deep	420	X

1) At the mounting version for the controls HP5, HP6 and EP5, EP6, the cast-in port designations **A** and **B** on the BVD counterbalance valve do not correspond with the port designation of the A6VM motor.

The designation of the ports on the installation drawing of the motor is binding!

2) For notes on tightening torques, see instruction manual

3) Depending on the application, momentary pressure peaks can occur. Keep this in mind when selecting measuring devices and fittings.

4) The countersink can be deeper than as specified in the standard.

5) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

Speed sensor

Version A6VM...U ("prepared for speed sensor", i.e. without sensor) is equipped with a spline on the rotary group.

A signal proportional to motor speed can be generated with the fitted DSA/DSM speed sensor. The DSA/DSM sensor registers the speed and direction of rotation.

Ordering code, technical data, dimensions and details on the connector, plus safety instructions about the sensor can be found in the relevant data sheet (95132 – DSM, 95133 – DSA).

The sensor is mounted on the port provided for this purpose with a mounting bolt. On deliveries without sensor, the port is plugged with a pressure-resistant cover.

We recommend ordering the A6VM variable motor complete with mounted sensor.

Installation instructions

General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the fluid from the axial piston unit may drain back to the reservoir via the hydraulic lines.

Particularly in the installation position "drive shaft upwards" filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The leakage in the motor housing must be directed to the reservoir via the highest available drain port (**T₁**, **T₂**).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the maximum permissible case pressure of all connected units is not exceeded at any operational conditions. If this is not possible, separate drain lines must be laid.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Notice

In certain installation positions, an influence on the control characteristic can be expected. Gravity, dead weight and case pressure can cause minor characteristic shifts and changes in response time.

Key	
F	Filling / air bleeding
U	Bearing flushing / air bleed port
T₁, T₂	Drain port
h_{t min}	Minimum required immersion depth (200 mm)
h_{min}	Minimum required spacing to reservoir bottom (100 mm)

Installation position

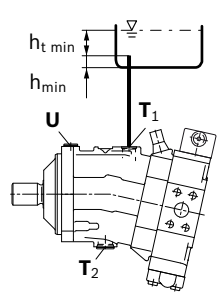

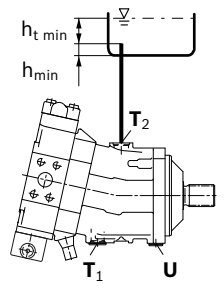

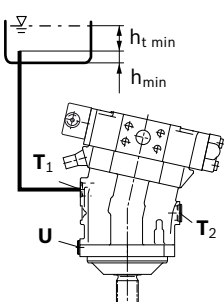

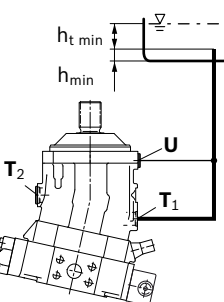

See examples **1** to **8** below.

Additional installation positions are available upon request.

Recommended installation position: **1** and **2**

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

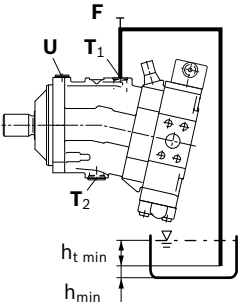

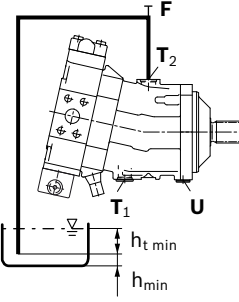

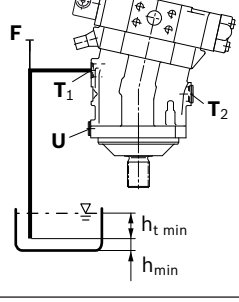

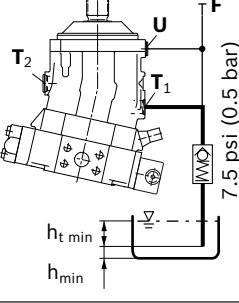

Installation position	Air bleed	Filling
1 		T₁
2 		T₂
3 		T₁
4 	U	T₁

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Recommendation for installation position 8 (drive shaft upward):

A check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the motor housing.

Installation position	Air bleed	Filling
<p>5</p> 	U (F)	T ₁ (F)
<p>6</p> 	F	T ₂ (F)
<p>7</p> 	F	T ₁ (F)
<p>8</p> 	U	T ₁ (F)

Notice

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

Project planning notes

- ▶ The motor A6VM is designed to be used in open and closed circuits.
- ▶ The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified skilled personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes contained herein must be observed.
- ▶ For safety reasons, controls with beginning of control at $V_{g \text{ min}}$ (e.g. HA) are not permissible for winch drives, e.g. anchor winches.
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or the instruction manual.
- ▶ Not all versions of the product are approved for use in a safety function according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. When a direct current is applied, solenoids do not cause electromagnetic interference nor is their operation impaired by electromagnetic interference.
Other behavior can result when a modulated direct current (e.g. PWM signal) is applied. Potential electromagnetic interference for persons (e.g. persons with a pacemaker) and other components must be tested by the machine manufacturer.
- ▶ Please note the details regarding the tightening torques of port threads and other threaded joints in the instruction manual.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports are only intended to accommodate hydraulic lines.

Safety instructions

- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve pistons) can, under certain circumstances get stuck in position as a result of contamination (e.g. impure hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filter) will not rule out a fault but merely reduce the risk.
The machine/system manufacturer must test whether remedial measures are needed on the machine for the application concerned in order to set the consumer being driven to a safe position (e.g. safe stop) and if necessary to ensure it is properly implemented.
- ▶ Moving parts in high-pressure relief valves may in certain circumstances become stuck in an undefined position due to contamination (e.g. contaminated hydraulic fluid). This can result in restriction or loss of the load holding function in lifting winches.
The machine/system manufacturer must check whether additional measures are required on the machine for the relevant application in order to keep the load in a safe position and ensure they are properly implemented.
- ▶ When using the axial piston motor in winch drives, make certain that the technical limit values are not exceeded under all operating conditions. If the axial piston motor is extremely overloaded (e.g. if the maximum permissible rotational speeds are exceeded during weighing of the anchor while the ship is in motion), the rotary group may be damaged and, in the worst case, the axial piston motor may burst. The machine manufacturer / system manufacturer is to undertake additional measures, up to and including encapsulation.

Axial piston variable motor A6VM

Features

- Variable motor with axial tapered piston rotary group of bent-axis design, for hydrostatic drives in open and closed circuit
- For use in mobile and stationary applications
- The wide control range enables the variable motor to satisfy the requirement for high speed and high torque.
- The displacement can be infinitely changed from $V_{g \max}$ to $V_{g \min} = 0$.
- The output speed is dependent on the flow of the pump and the displacement of the motor.
- The output torque increases with the pressure differential between the high and low-pressure side and with increasing displacement.
- Wide control range with hydrostatic transmissions
- Wide selection of control devices
- Cost savings through elimination of gear shifts and possibility of using smaller pumps
- Compact, robust motor with long service life
- High power density
- Good starting efficiency
- Version with 9-piston rotary group
- Good low speed characteristics
- High uniformity

2) The adjustment values for the setting screws can be found in the table (page 23).

3) Specify the required flushing flow at $\Delta p = p_{ND} - p_G$ and at $v = 10 \text{ mm}^2/\text{s}$ in plain text when ordering (p_{ND} = low pressure, p_G = case pressure, standard 25 bar).

4) Specify ordering code of sensor according to data sheet (HDD – RE 95135) separately and observe the requirements on the electronics.

Technical data

Hydraulic fluid

Before starting project planning, please refer to our data sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable hydraulic fluids) and RE 90222 (HFD hydraulic fluids) for detailed information regarding the selection of hydraulic fluid and application conditions.

The variable motor A6VM is not suitable for operation with HFA hydraulic fluid. If HFB, HFC, or HFD or environmentally acceptable hydraulic fluids are used, the limitations regarding technical data must be observed or other seals used. Please contact us.

Selection diagram

Details regarding the selection of hydraulic fluid

Choosing the correct hydraulic fluid requires knowledge of the operating temperature in relation to the ambient temperature: the circuit temperature in a closed circuit, the reservoir temperature in an open circuit.

The hydraulic fluid should be selected so that the operating viscosity in the operating temperature range is within the optimum range (v_{opt}) see shaded area of the selection diagram. We recommend that the higher viscosity class be selected in each case.

Example: At an ambient temperature of X °C, an operating temperature of 60 °C is set in the circuit. In the optimum viscosity range ($v_{opt,1}$ shaded area) this corresponds to the viscosity classes VG 46 and VG 68. To be selected: VG 68.

Note

The case drain temperature, which is affected by pressure and speed, can be higher than the circuit temperature or reservoir temperature. At no point of the component may the temperature be higher than 115 °C. The temperature difference specified below is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend flushing the case at port U or using a flushing and boost pressure valve (see page 22).

Viscosity and temperature of hydraulic fluid

	Viscosity [mm ² /s]	Temperature	Comment
Transport and storage at ambient temperature		$T_{min} \geq -50$ °C $T_{opt} = +5$ °C to $+20$ °C	factory preservation: up to 12 months with standard, up to 24 months with long-term
(Cold) start-up ¹⁾	$v_{max} = 1600$	$T_{St} \geq -40$ °C	$t \leq 3$ min, without load ($p \leq 50$ bar), $n \leq 1000$ rpm
Permissible temperature difference		$\Delta T \leq 25$ K	between axial piston unit and hydraulic fluid in the system
Warm-up phase	$v < 1600$ to 400	$T = -40$ °C to -25 °C	at $p \leq 0.7 \cdot p_{nom}$, $n \leq 0.5 \cdot n_{nom}$ and $t \leq 15$ min
Operating phase			
Temperature difference		$\Delta T = \text{approx. } 12$ K	Between hydraulic fluid in the bearing and at port T. The bearing temperature can be reduced by flushing via port U.
Maximum temperature		115 °C 103 °C	in the bearing measured at port T
Continuous operation	$v = 400$ to 10 $v_{opt} = 36$ to 16	$T = -25$ °C to $+90$ °C	measured at port T, no restriction within the permissible data
Short-term operation ²⁾	$v_{min} \geq 7$	$T_{max} = +103$ °C	measured at port T, $t < 3$ min, $p < 0.3 \cdot p_{nom}$
FKM shaft seal ¹⁾		$T \leq +115$ °C	see page 5

1) At temperatures below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

2) Please contact us.

Technical data

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

To ensure the functional reliability of the axial piston unit, a gravimetric analysis of the hydraulic fluid is necessary to determine the amount of solid contaminant and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 is to be maintained.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

If the above classes cannot be achieved, please contact us.

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the speed of the axial piston unit and the case drain pressure (case pressure). The mean differential pressure of 2 bar between the case and the ambient pressure may not be enduringly exceeded at normal operating temperature. For a higher differential pressure at reduced speed, see diagram. Momentary pressure spikes ($t < 0.1$ s) of up to 10 bar are permitted. The service life of the shaft seal decreases with an increase in the frequency of pressure spikes.

The case pressure must be equal to or higher than the ambient pressure.

The values are valid for an ambient pressure $p_{\text{abs}} = 1$ bar.

Temperature range

The FKM shaft seal may be used for case drain temperatures from -25 °C to +115 °C.

Note

For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C). State NBR shaft seal in plain text when ordering. Please contact us.

Influence of case pressure on beginning of control

An increase in case pressure affects the beginning of control of the variable motor when using the following control options:

HP, HA.T3 _____ increase
DA _____ decrease

With the following settings, an increase in case pressure will have no effect on the beginning of control: EP, HA

The factory setting of the beginning of control is made at $p_{\text{abs}} = 2$ bar case pressure.

Flow direction

Direction of rotation, viewed on drive shaft

clockwise	counter-clockwise

Technical data

Operating pressure range

(operating with mineral oil)

Pressure at service line port A or B

Nominal pressure p_{nom} _____ 450 bar absolute

Maximum pressure p_{max} _____ 500 bar absolute

Single operating period at $V_{g max}$ and $n_{max} = n_{nom} / 2$ _____ 10 s

Total operating period _____ 300 h

Minimum pressure (high-pressure side) _____ 25 bar absolute

Summation pressure (pressure A + pressure B) p_{Su} 700 bar

Rate of pressure change $R_{A max}$

with integrated pressure-relief valve _____ 9000 bar/s without

pressure-relief valve _____ 16000 bar/s

Minimum pressure – pump operation (inlet)

To prevent damage to the axial piston motor in pump operation mode (change of high-pressure side with unchanged direction of rotation, e. g. when braking), a minimum pressure must be guaranteed at the service line port (inlet). This minimum pressure is dependent on the speed and displacement of the axial piston unit (see characteristic curve below).

This diagram is only valid for the optimum viscosity range from $\nu_{opt} = 36$ to $16 \text{ mm}^2/\text{s}$.

Please contact us if the above conditions cannot be guaranteed.

Note

Values for other hydraulic fluids, please contact us.

Definition

Nominal pressure p_{nom}

The nominal pressure corresponds to the maximum design pressure.

Maximum pressure p_{max}

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

Minimum pressure (high-pressure side)

Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

Summation pressure p_{Su}

The summation pressure is the sum of the pressures at both service line ports (A and B).

Rate of pressure change R_A

Maximum permissible rate of pressure build-up and reduction during a pressure change over the entire pressure range.

$$\text{Total operating period} = t_1 + t_2 + \dots + t_n$$

Technical data

Table of values (theoretical values, without efficiency and tolerances; values rounded)

Size	NG		280
Displacement geometric, per revolution	$V_{g \max}$	cm ³	280.1
	$V_{g \min}$	cm ³	0
	$V_{g x}$	cm ³	118 (see diagram below)
Maximum speed ¹⁾ (while adhering to the maximum permissible input flow)			
at $V_{g \max}$	n_{nom}	rpm	2500
At $V_g < V_{g x}$ (see diagram below)	n_{max}	rpm	3550
at $V_{g 0}$	n_{max}	rpm	following consultation
Input flow at n_{nom} and $V_{g \max}$	$q_{V \max}$	l/min	700
Torque ²⁾ at $V_{g \max}$ and $\Delta p = 450$ bar	T	Nm	2006
Rotary stiffness			
$V_{g \max}$ to $V_g/2$	c_{min}	kNm/rad	72
$V_g/2$ to 0 (interpolated)	c_{max}	kNm/rad	209
Moment of inertia for rotary group	J_{GR}	kgm ²	0.0479
Maximum angular acceleration	α	rad/s ²	7000
Case volume	V	L	3.4
Weight (approx.)	m	kg	101

Note

Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, such as speed variation, reduced angular acceleration as a function of the frequency and the permissible angular acceleration at start (lower than the maximum angular acceleration) can be found in data sheet RE 90261.

Permissible displacement in relation to speed

- The following values apply:
 - For the optimum viscosity range from $v_{\text{opt}} = 36$ to 16 mm²/s
 - With hydraulic fluid based on mineral oils
- Torque without radial force, with radial force see page 8
- Values in this range on request

Determining the operating characteristics

$$\begin{aligned} \text{Input flow} \quad q_v &= \frac{V_g \cdot n}{1000 \cdot \eta_v} && [\text{L/min}] \\ \text{Rotational speed} \quad n &= \frac{q_v \cdot 1000 \cdot \eta_v}{V_g} && [\text{rpm}] \\ \text{Torque} \quad T &= \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi} && [\text{Nm}] \\ \text{Power} \quad P &= \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600} && [\text{kW}] \end{aligned}$$

V_g = Displacement per revolution in cm³

Δp = Differential pressure in bar

n = Speed in rpm

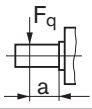

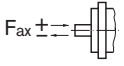

η_v = Volumetric efficiency

η_{mh} = Mechanical-hydraulic efficiency

η_t = Total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

Technical data

Permissible radial and axial forces of the drive shafts

Size	NG	280	280
Drive shaft		2 1/4	W60
Maximum radial force ¹⁾ at distance a(from shaft collar)		$F_{q \max}$ N	26821 26913
		a mm	40 35
with permissible torque	T_{\max} Nm	1916	2005
\triangleq permissible pressure Δp at $V_{g \max}$	$p_{\text{nom perm.}}$ bar	430	450
Maximum axial force ²⁾		$+ F_{ax \max}$ N	1575 1575
		$- F_{ax \max}$ N	0 ³⁾ 0 ³⁾
Permissible axial force per bar operating pressure	$F_{ax \text{ perm./bar}}$ N/bar	19.4	19.4

1) With intermittent operation.

2) Maximum permissible axial force during standstill or when the axial piston unit is operating in non-pressurized condition.

3) Please contact us.

Note

Influence of the direction of the permissible axial force:

+ $F_{ax \max}$ = Increase in service life of bearings

- $F_{ax \max}$ = Reduction in service life of bearings (avoid)

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

Toothed gear output drive

V-belt output

HP – Proportional hydraulic control

The proportional hydraulic control, type HP, provides infinite adjustment of the displacement, proportional to the pilot pressure applied to port X.

HP1, HP2 positive control

- Beginning of control at $V_{g\ min}$ (minimum torque, maximum permissible speed at minimum pilot pressure)
- End of control at $V_{g\ max}$ (maximum torque, minimum speed at maximum pilot pressure)

HP5, HP6 negative control

- Beginning of control at $V_{g\ max}$ (maximum torque, minimum speed at minimum pilot pressure)
- End of control at $V_{g\ min}$ (minimum torque, maximum permissible speed at maximum pilot pressure)

Note

- Maximum permissible pilot pressure: $p_{St} = 100\ bar$
- The control oil is internally taken out of the high pressure side of the motor (A or B). For reliable control, an operating pressure of at least 30 bar is required in A (B). If a control operation is performed at an operating pressure $< 30\ bar$, an auxiliary pressure of at least 30 bar must be applied at port G via an external check valve. For lower pressures, please contact us.
Please note that pressures up to 500 bar can occur at port G.
- Please state the desired beginning of control in plain text when ordering, e. g.: beginning of control at 10 bar.
- The beginning of control and the HP characteristic are influenced by the case pressure. An increase in case pressure causes an increase in the beginning of control (see page 5) and thus a parallel shift of the characteristic.

HP1, HP5 pilot pressure increase $\Delta p_{St} = 10\ bar$

HP1 positive control

A pilot pressure increase of 10 bar at port X results in an increase in displacement from $V_{g\ min}$ to $V_{g\ max}$.

HP5 negative control

A pilot pressure increase of 10 bar at port X results in a decrease in displacement from $V_{g\ max}$ to $V_{g\ min}$.

Beginning of control, setting range _____ 2 to 20 bar

Standard setting:

Beginning of control at 3 bar (end of control at 13 bar)

Note

The spring feedback feature in the control part is not a safety device

The control part can stick in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, control of the axial piston motor will no longer respond correctly to the operator's commands.

Check whether the application on your machine requires additional safety measures, in order to bring the driven consumer into a safe position (immediate stop). If necessary, make sure that these are properly implemented.

Characteristic

HP2, HP6 pilot pressure increase $\Delta p_{St} = 25\ bar$

HP2 positive control

A pilot pressure increase of 25 bar at port X results in an increase in displacement from $V_{g\ min}$ to $V_{g\ max}$.

HP6 negative control

A pilot pressure increase of 25 bar at port X results in a decrease in displacement from $V_{g\ max}$ to $V_{g\ min}$.

Beginning of control, setting range _____ 5 to 35 bar

Standard setting:

Beginning of control at 10 bar (end of control at 35 bar)

Characteristic

Schematic HP1, HP2: positive control on request.
Schematic HP5, HP6: negative control on request.

HP – Proportional hydraulic control

HP5D1, HP6D1

Pressure control, fixed setting

The pressure control overrides the HP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger displacement.

The increase in the displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve _____ 80 to 450 bar

Schematic HP5D1, HP6D1: negative control on request.

EP – Proportional electric control

The proportional electric control, type EP, provides infinite adjustment of the displacement, proportional to the control current applied to the solenoid.

EP1, EP2 positive control

- Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible speed at minimum control current)
- End of control at $V_{g \max}$ (maximum torque, minimum speed at maximum control current)

EP5, EP6 negative control

- Beginning of control at $V_{g \max}$ (maximum torque, minimum speed at minimum control current)
- End of control at $V_{g \min}$ (minimum torque, maximum permissible speed at maximum control current)

Characteristic

Note

The control oil is internally taken out of the high pressure side of the motor (A or B). For reliable control, an operating pressure of at least 30 bar is required in A (B). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port G via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 500 bar can occur at port G.

Technical data, solenoid

- Series 22 _____ RE 95202
- Series 30 _____ RE 95203, RE 95204
and application software

– Analog amplifier RA _____ RE 95230

- Electric amplifier VT 2000, series 5X (see RE 29904)
(for stationary application)

Note

The spring feedback feature in the control part is not a safety device

The control part can stick in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, control of the axial piston motor will no longer respond correctly to the operator's commands.

Check whether the application on your machine requires additional safety measures, in order to bring the driven consumer into a safe position (immediate stop). If necessary, make sure that these are properly implemented.

EP – Proportional electric control

Schematic EP1, EP2: positive control

Schematic EP1, EP2: negative control

EP5D1, EP6D1

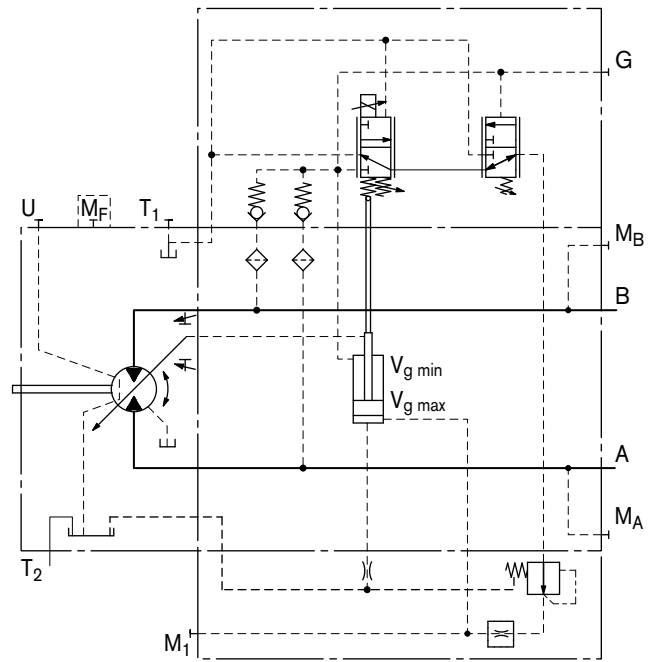

Pressure control, fixed setting

The pressure control overrides the EP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger displacement.

The increase in the displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve ____ 80 to 450 bar

Schematic EP5D1, EP6D1: negative control

HZ – Two-point hydraulic control

The two-point hydraulic control, type HZ, allows the displacement to be set to either $V_{g \min}$ or $V_{g \max}$ by switching the pilot pressure at port X on or off.

HZ5 negative control

- Position at $V_{g \max}$ (without pilot pressure, maximum torque, minimum speed)
- Position at $V_{g \min}$ (with pilot pressure > 10 bar activated, minimum torque, maximum permissible speed)

Characteristic HZ5

Note

- Maximum permissible pilot pressure: 100 bar
- The control oil is internally taken out of the high pressure side of the motor (A or B). For reliable control, an operating pressure of at least 30 bar is required in A (B). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port G via an external check valve. For lower pressures, please contact us.
Please note that pressures up to 500 bar can occur at port G.

Schematic HZ5: negative control on request.

EZ – Two-point electric control

The two-point electric control, type EZ, allows the displacement to be set to either $V_{g \text{ min}}$ or $V_{g \text{ max}}$ by switching the electric current to a switching solenoid on or off.

Note

The control oil is internally taken out of the high pressure side of the motor (A or B). For reliable control, an operating pressure of at least 30 bar is required in A (B). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port G via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 500 bar can occur at port G.

Type of protection see connector version page 21		

Schematic EZ5, EZ6: negative control on request.

HA – Automatic high-pressure related control

The automatic high-pressure related control, type HA, adjusts the displacement automatically depending on the operating pressure.

The displacement of the A6VM motor with HA control is $V_{g \min}$ (maximum speed and minimum torque). The control device measures internally the operating pressure at A or B (no control line required) and upon reaching the beginning of control, the controller swivels the motor from $V_{g \min}$ to $V_{g \max}$ with increase of pressure. The displacement is modulated between $V_{g \min}$ and $V_{g \max}$, thereby depending on load conditions.

HA1, HA2 positive control

- Beginning of control at $V_{g \min}$ (minimum torque, maximum speed)
- End of control at $V_{g \max}$ (maximum torque, minimum speed)

Note

- For safety reasons, winch drives are not permissible with beginning of control at $V_{g \min}$ (standard for HA).
- The control oil is internally taken out of the high pressure side of the motor (A or B). For reliable control, an operating pressure of at least 30 bar is required in A (B). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port G via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 500 bar can occur at port G.

- The beginning of control and the HA.T3 characteristic are influenced by case pressure. An increase in case pressure causes an increase in the beginning of control (see page 5) and thus a parallel shift of the characteristic.

HA1

With minimum pressure increase, positive control

An operating pressure increase of $\Delta p \leq \text{approx. } 10 \text{ bar}$ results in an increase in displacement from $V_{g \min}$ towards $V_{g \max}$.

Beginning of control, setting range _____ 80 to 350 bar

Please state the desired beginning of control in plain text when ordering, e. g.: beginning of control at 300 bar.

Characteristic HA1

Schematic HA1 on request.

HA – Automatic high-pressure related control

HA2

With pressure increase, positive control

An operating pressure increase of $\Delta p = \text{approx. } 100 \text{ bar}$ results in an increase in displacement from $V_{g \text{ min}}$ towards $V_{g \text{ max}}$.

Beginning of control, setting range _____ 80 to 350 bar

Please state the desired beginning of control in plain text when ordering, e. g.: beginning of control at 200 bar.

Characteristic HA2

Schematic HA2 on request.

HA.T3

Override, hydraulic remote control, proportional

With the HA.T3 control, the beginning of control can be influenced by applying a pilot pressure to port X.

For each 1 bar of pilot pressure increase, the beginning of control is reduced by 23 bar.

Beginning of control setting	300 bar	300 bar
Pilot pressure at port X	0 bar	10 bar
Beginning of control at	300 bar	70 bar

Note

Maximum permissible pilot pressure 100 bar.

Schematic HA.T3 on request.

DA – Automatic speed-related control

The variable motor A6VM with automatic speed-related control, type DA, is intended for use in hydrostatic travel drives in combination with the variable pump A4VG with DA control.

A pilot pressure generated by the variable pump regulates, together with the operating pressure, the swivel angle of the hydraulic motor.

Increasing pilot pressure causes the motor to swivel to a smaller displacement (lower torque, higher rotational speed), depending on the operating pressure.

If the operating pressure exceeds the pressure setpoint value set on the controller, the variable motor swivels to a larger displacement (higher torque, lower speed).

Pressure ratio p_{SV}/p_{HD} _____ 5/100

DA closed loop control is only suitable for certain types of drive systems and requires review of the engine and vehicle parameters to ensure that the motor is used correctly and that machine operation is safe and efficient. We recommend that all DA applications be reviewed by a Bosch Rexroth application engineer.

Note

The beginning of control and the DA characteristic are influenced by case pressure. An increase in case pressure causes a decrease in the beginning of control (see page 5) and thus a parallel shift of the characteristic.

EP1, EP2

Proportional electric control, positive control

Connector for solenoids

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

DEUTSCH DT04-2P-EP04

Molded connector, 2-pin, without bidirectional suppressor diode

There is the following type of protection with mounted mating connector:

IP67 _____ DIN/EN 60529

and IP69K _____ DIN 40050-9

Circuit symbol

Mating connector

DEUTSCH DT06-2S-EP04

Bosch Rexroth material number R902601804

Consisting of: _____ DT designation

– 1 housing _____ DT06-2S-EP04

– 1 wedge _____ W2S

– 2 sockets _____ 0462-201-16141

The mating connector is not included in the scope of supply. This can be supplied by Bosch Rexroth on request.

Changing connector orientation

If necessary, you can change the connector orientation by turning the solenoid housing.

To do this, proceed as follows:

1. Loosen the mounting nut (1) of the solenoid. To do this, turn the mounting nut (1) one turn counter-clockwise.
2. Turn the solenoid body (2) to the desired orientation.
3. Retighten the mounting nut. Tightening torque: 5+1 Nm. (size WAF 26, 12 kt DIN 3124)

On delivery, the connector orientation may differ from that shown in the brochure or drawing.

Flushing and boost pressure valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

The flushing and boost pressure valve is used to remove heat from the hydraulic circuit.

In an open circuit, it is used only for flushing the housing.

In a closed circuit, it ensures a minimum boost pressure level in addition to the case flushing.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the case drain fluid. The hydraulic fluid, removed out of the closed circuit must be replaced by cooled hydraulic fluid from the boost pump.

The valve is mounted onto the port plate or integrated (depending on the control type and size).

Cracking pressure of pressure retaining valve

(observe when adjusting the primary valve)

adjustable _____ 15 to 35 bar

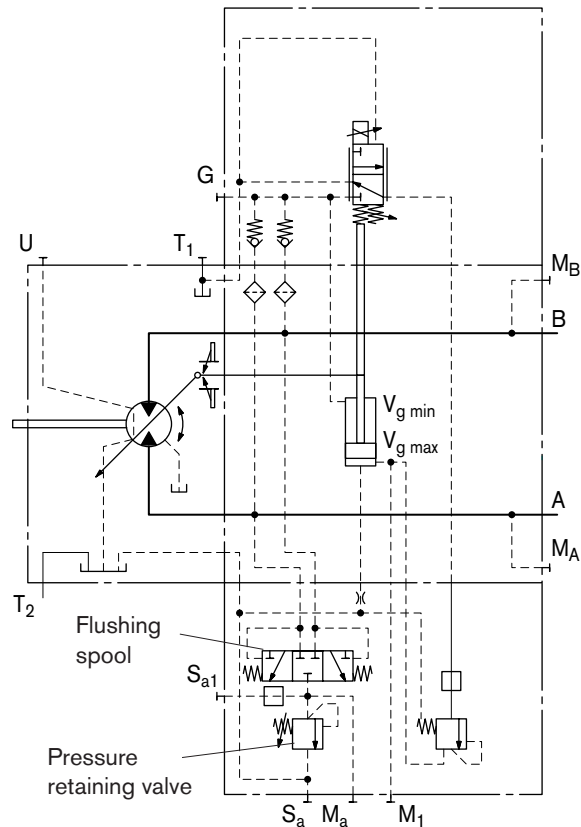

Switching pressure of flushing spool Δp _____ on request

Flushing flow q_v

(Flushing flow up to 60 L/min possible, please contact us)

For a flushing flow greater than 35 l/min, it is recommended that port S_a be connected in order to prevent an increase in the case pressure. An increased case pressure reduces the flushing flow.

Specify exact settings for $V_{g \min}$ and $V_{g \max}$ in plain text when ordering:

$V_{g \min} = \dots \text{ cm}^3$, $V_{g \max} = \dots \text{ cm}^3$

Theoretical, maximum setting:

for $V_{g \min} = 0.7 \cdot V_{g \max}$

for $V_{g \max} = 0.3 \cdot V_{g \max}$

Settings that are not listed in the table may lead to damage. Please contact us.

Speed sensor

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Version A6VM...F ("prepared for speed sensor", i.e. without sensor) is equipped with a spline on the rotary group.

On the version "prepared for speed sensor", the port is plugged with a pressure-resistant cover.

A signal proportional to motor rotational speed can be generated with the mounted HDD speed sensor. The sensors register the speed and direction of rotation.

Ordering code, technical data, dimensions and details on the connector, plus safety instructions about the sensor can be found in the relevant data sheet.

HDD _____ RE 95135

Version "H"

Suitable for mounting the HDD speed sensor. The sensor is flanged onto the port provided for this purpose with two mounting bolts.

We recommend ordering the A6VM variable motor complete with installed sensor.

Schematic

Dimensions

Version "H" with HDD sensor

Installation instructions

General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

Particularly in the installation position "drive shaft upwards" filling and air bleeding via flushing port U must be carried out completely as there is, for example, a danger of dry running.

The case drain fluid in the motor housing must be directed to the reservoir via the highest available drain port (T_1 , T_2).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the minimum permissible case pressure of all connected units is not exceeded in any situation. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Installation position

See the following examples 1 to 8.

Further installation positions are possible upon request.

Recommended installation positions: 1 and 2.

Note

In certain installation positions, an influence on the control characteristics can be expected. Gravity, dead weight and case pressure can cause minor shifts in control characteristics and changes in response time.

Installation position	Air bleed	Filling
1	–	T_1
2	–	T_2
3	–	T_1
4	U	T_1
5	U (L_1)	T_1 (L_1)
6	L_1	T_2 (L_1)
7	L_1	T_1 (L_1)
8	U	T_1 (L_1)

L_1 Filling / air bleed

U Bearing flushing / air bleed port

T_1, T_2 Drain port

$h_{t\ min}$ Minimum required immersion depth (200 mm)

h_{min} Minimum required distance to reservoir bottom (100 mm)

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Recommendation for installation position 8 (drive shaft upward): A check valve in the reservoir line (cracking pressure 0.5 bar) can prevent draining of the case interior.

General instructions

- The motor A6VM is designed to be used in open and closed circuits.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of skilled person.
- Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e. g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- Not all variants of the product are approved for use in safety functions according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
- The following tightening torques apply:
 - Fittings:
 - Observe the manufacturer's specifications regarding the tightening torques of the fittings used.
 - Mounting bolts:
 - For mounting bolts with metric ISO thread according to DIN 13 or with thread according to ASME B1.1, we recommend checking the tightening torque in individual cases as per VDI 2230.
 - Female threads of the axial piston unit:
 - The maximum permissible tightening torques $M_{G \max}$ are maximum values for the female threads and must not be exceeded. For values, see the following table.
 - Threaded plugs:
 - For the metallic threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs M_V apply. For values, see the following table.

Ports		Maximum permissible tightening torque of the female threads $M_{G \max}$	Required tightening torque of the threaded plugs M_V	WAF hexagon socket for the threaded plugs
Standard	Thread size			
ISO 6149	M14 x 1.5	80 Nm	45 Nm	6 mm
	M22 x 1.5	210 Nm	100 Nm	10 mm
	M33 x 2	540 Nm	310 Nm	17 mm
	M42 x 2	720 Nm	330 Nm	22 mm

Features

- Variable plug-in motor with axial tapered piston rotary group of bent-axis design, for hydrostatic drives in open and closed circuits
- Far-reaching integration in mechanical gearbox due to a recessed mounting flange located on the center of the case (extremely space-saving construction)
- Easy to install, simply plug into the mechanical gearbox (no configuration specifications to be observed)
- Tested unit ready to install
- For use especially in mobile applications
- The displacement can be infinitely changed from $V_{g \max}$ to $V_{g \min} = 0$.
- The wide control range enables the variable motor to satisfy the requirement for high speed and high torque.
- The output speed is dependent on the flow of the pump and the displacement of the motor.
- The output torque increases with the pressure differential between the high-pressure and low-pressure side and with increasing displacement.

9) Counterbalance valve MHB32, please contact us.

Technical data

Hydraulic fluid

Before starting project planning, please refer to our data sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable hydraulic fluids), RE 90222 (HFD hydraulic fluids) and RE 90223 (HFA, HFB, HFC hydraulic fluids) for detailed information regarding the choice of hydraulic fluid and application conditions.

The variable motor A6VE is not suitable for operation with HFA hydraulic fluid. If HFB, HFC, or HFD or environmentally acceptable hydraulic fluids are used, the limitations regarding technical data or other seals must be observed.

Selection diagram

Details regarding the choice of hydraulic fluid

The correct choice of hydraulic fluid requires knowledge of the operating temperature in relation to the ambient temperature: in a closed circuit, the circuit temperature, in an open circuit, the reservoir temperature.

The hydraulic fluid should be chosen so that the operating viscosity in the operating temperature range is within the optimum range (ν_{opt} see shaded area of the selection diagram). We recommended that the higher viscosity class be selected in each case.

Example: At an ambient temperature of X °C, an operating temperature of 60 °C is set in the circuit. In the optimum viscosity range (ν_{opt} , shaded area) this corresponds to the viscosity classes VG 46 or VG 68; to be selected: VG 68.

Note

The case drain temperature, which is affected by pressure and speed, can be higher than the circuit temperature or reservoir temperature. At no point of the component may the temperature be higher than 115 °C. The temperature difference specified below is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend flushing the case with a flushing and boost pressure valve (see page 29).

Viscosity and temperature of hydraulic fluid

	Viscosity [mm ² /s]	Temperature	Comment
Transport and storage at ambient temperature		$T_{min} \geq -50 \text{ °C}$ $T_{opt} = +5 \text{ °C to } +20 \text{ °C}$	factory preservation: up to 12 months with standard, up to 24 months with long-term
(Cold) start-up ¹⁾	$\nu_{max} = 1600$	$T_{St} \geq -40 \text{ °C}$	$t \leq 3 \text{ min}$, without load ($p \leq 50 \text{ bar}$), $n \leq 1000 \text{ rpm}$ (sizes 28 to 160), $n \leq 0.25 \cdot n_{nom}$ (size 250)
Permissible temperature difference		$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid
Warm-up phase	$\nu < 1600 \text{ to } 400$	$T = -40 \text{ °C to } -25 \text{ °C}$	At $p \leq 0.7 \cdot p_{nom}$, $n \leq 0.5 \cdot n_{nom}$ and $t \leq 15 \text{ min}$
Operating phase			
Temperature difference		$\Delta T = \text{approx. } 12 \text{ K}$	between hydraulic fluid in the bearing and at port T
Maximum temperature		115 °C 103 °C	in the bearing measured at port T
Continuous operation	$\nu = 400 \text{ to } 10$ $\nu_{opt} = 36 \text{ to } 16$	$T = -25 \text{ °C to } +90 \text{ °C}$	measured at port T, no restriction within the permissible data
Short-term operation ²⁾	$\nu_{min} \geq 7$	$T_{max} = +103 \text{ °C}$	measured at port T, $t < 3 \text{ min}$, $p < 0.3 \cdot p_{nom}$
FKM shaft seal ¹⁾		$T \leq +115 \text{ °C}$	see page 5

1) At temperatures below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

2) Size 250, please contact us.

Technical data

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

To ensure the functional reliability of the axial piston unit, a gravimetric analysis of the hydraulic fluid is necessary to determine the amount of solid contaminant and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 is to be maintained.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

If the above classes cannot be achieved, please contact us.

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the speed of the axial piston unit and the case drain pressure (case pressure). The mean differential pressure of 2 bar between the case and the ambient pressure may not be enduringly exceeded at normal operating temperature. For a higher differential pressure at reduced speed, see diagram. Momentary pressure spikes ($t < 0.1$ s) of up to 10 bar are permitted. The service life of the shaft seal decreases with an increase in the frequency of pressure spikes.

The case pressure must be equal to or higher than the ambient pressure.

The values are valid for an ambient pressure $p_{abs} = 1$ bar.

Temperature range

The FKM shaft seal may be used for case drain temperatures from -25 °C to +115 °C.

Note

For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C). State NBR shaft seal in plain text when ordering. Please contact us.

Influence of case pressure on beginning of control

An increase in case pressure affects the beginning of control of the variable motor when using the following control options:

HD, HA.T (sizes 28 to 160) _____ increase
 HD, EP, HA, HA.T (size 250) _____ increase
 DA _____ decrease

With the following controls, an increase in the case pressure has no influence on the beginning of control:
 EP, HA (sizes 28 to 160)

The factory settings for the beginning of control are made at $p_{abs} = 2$ bar (sizes 28 to 160) or $p_{abs} = 1$ bar (size 250) case pressure.

Direction of flow

Direction of rotation, viewed on drive shaft

cw	ccw

Nominal pressure p_{nom} _____ 400 bar absolute

Maximum pressure p_{max} _____ 450 bar absolute

Single operating period _____ 10 s

Total operating period _____ 300 h

Size 250

Nominal pressure p_{nom} _____ 350 bar absolute

Maximum pressure p_{max} _____ 400 bar absolute

Single operating period _____ 10 s

Total operating period _____ 300 h

Minimum pressure (high-pressure side) _____ 25 bar absolute

Summation pressure (pressure A + pressure B) p_{Su} _____ 700 bar

Rate of pressure change R_{Amax}

with integrated pressure-relief valve _____ 9000 bar/s

without pressure-relief valve _____ 16000 bar/s

Minimum pressure – pump mode (inlet)

To prevent damage to the axial piston motor in pump operation mode (change of high-pressure side with unchanged direction of rotation, e. g. when braking), a minimum pressure must be guaranteed at the service line port (inlet). This minimum pressure is dependent on the speed and displacement of the axial piston unit (see characteristic curve below).

¹⁾ For sizes 28 to 160

²⁾ For size 250

This diagram is valid only for the optimum viscosity range from $v_{opt} = 36$ to $16 \text{ mm}^2/\text{s}$.

Please contact us if the above conditions cannot be satisfied.

Note

Values for other hydraulic fluids, please contact us.

Definition

Nominal pressure p_{nom}

The nominal pressure corresponds to the maximum design pressure.

Maximum pressure p_{max}

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

Minimum pressure (high-pressure side)

Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

Summation pressure p_{Su}

The summation pressure is the sum of the pressures at both service line ports (A and B).

Rate of pressure change R_A

Maximum permissible rate of pressure rise and reduction during a pressure change over the entire pressure range.

Total operating period = $t_1 + t_2 + \dots + t_n$

- 1) The minimum and maximum displacement are infinitely adjustable, see ordering code, page 2.
(standard setting for size 250 if not specified in the order: $V_{g \min} = 0.2 \cdot V_{g \max}$, $V_{g \max} = V_{g \max}$).
- 2) The values are valid:
 - for the optimum viscosity range from $\nu_{\text{opt}} = 36$ to 16 mm²/s
 - with hydraulic fluid based on mineral oils
- 3) Restriction of input flow with counterbalance valve, see page 32
- 4) Torque without radial force, with radial force see page 8

Note

Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, with respect to speed variation, reduced angular acceleration as a function of the frequency and the permissible startup angular acceleration (lower than the maximum angular acceleration) can be found in data sheet RE 90261.

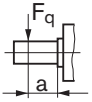

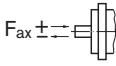

Permissible displacement in relation to speed

- 5) Values in this range on request

		$-F_{ax \max}$	N	0	0	0	0	0	0
Permissible axial force per bar operating pressure		$F_{ax \text{ perm./bar}}$	N/bar	4.6	7.5	9.6	11.3	15.1	4)

1) With intermittent operation.

2) Maximum permissible axial force during standstill or when the axial piston unit is operating in non-pressurized condition.

3) When at a standstill or when axial piston unit operating in non-pressurized conditions. Higher forces are permissible when under pressure, please contact us.

4) Please contact us.

Note

Influence of the direction of the permissible axial force:

$+F_{ax \max}$ = Increase in service life of bearings

$-F_{ax \max}$ = Reduction in service life of bearings (avoid)

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

Toothed gear drive

V-belt drive

Determining the operating characteristics

Input flow	$q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v}$	[L/min]	V_g = Displacement per revolution in cm^3
			Δp = Differential pressure in bar
Speed	$n = \frac{q_v \cdot 1000 \cdot \eta_v}{V_g}$	$[\text{min}^{-1}]$	n = Speed in rpm
			η_v = Volumetric efficiency
Torque	$T = \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi}$	[Nm]	η_{mh} = Mechanical-hydraulic efficiency
			η_t = Total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)
Power	$P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600}$	[kW]	

HD – Proportional control hydraulic

The proportional hydraulic control provides infinite setting of the displacement, proportional to the pilot pressure applied to port X.

- Beginning of control at $V_{g \max}$ (maximum torque, minimum speed at minimum pilot pressure)
- End of control at $V_{g \min}$ (minimum torque, maximum permissible speed at maximum pilot pressure)

Note

- Maximum permissible pilot pressure: $p_{St} = 100$ bar
- The control oil is internally taken out of the high-pressure side of the motor (A or B). For reliable control, an operating pressure of at least 30 bar is required in A (B). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port G via an external check valve. For lower pressures, please contact us.
Please note that pressures up to 450 bar can occur at port G.
- Please state the desired beginning of control in plain text when ordering, e. g.: beginning of control at 10 bar.
- The beginning of control and the HD characteristic are influenced by the case pressure. An increase in case pressure causes an increase in the beginning of control (see page 5) and thus a parallel shift of the characteristic.
- A leakage flow of maximum 0.3 L/min can escape at port X due to internal leakage (operating pressure > pilot pressure). The control is to be suitably configured to avoid an independent build-up of pilot pressure.

HD2

Pilot pressure increase $\Delta p_{St} = 25$ bar

A pilot pressure increase of 25 bar at port X results in a decrease in displacement from $V_{g \max}$ to 0 cm³ (sizes 28 to 160) or from $V_{g \max}$ to 0.2 $V_{g \max}$ (size 250).

Beginning of control, setting range _____ 5 to 35 bar

Standard setting:

Beginning of control at 10 bar (end of control at 35 bar)

HD2 characteristic

HD1

Pilot pressure increase $\Delta p_{St} = 10$ bar

A pilot pressure increase of 10 bar at port X results in a decrease in displacement from $V_{g \max}$ to 0 cm³ (sizes 28 to 160) or from $V_{g \max}$ to 0.2 $V_{g \max}$ (size 250).

Beginning of control, setting range _____ 2 to 20 bar

Standard setting:

Beginning of control at 3 bar (end of control at 13 bar)

HD1 characteristic

HD – Proportional control hydraulic

Schematic HD1, HD2
Sizes 28 to 160

Schematic HD1, HD2
Size 250

Note

The spring return feature in the control part is not a safety device

The control part can stick in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the control will no longer respond correctly to the operator's commands.

Check whether the application on your machine requires additional safety measures, in order to bring the driven actuator into a controlled and safe position (immediate stop). If necessary, make sure these are properly implemented.

HD – Proportional control hydraulic

HD.D Pressure control, fixed setting

The pressure control overrides the HD control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint of the pressure control, the motor will swivel towards a larger displacement.

The increase in the displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

EP – Proportional control electric

The proportional electric control provides infinite setting of the displacement, proportional to the control current applied to the solenoid (sizes 28 to 200) or proportional valve (sizes 250).

For size 250, the pilot oil supply at port P requires an external pressure of $p_{\min} = 30 \text{ bar}$ ($p_{\max} = 100 \text{ bar}$).

- Beginning of control at $V_{g \max}$ (maximum torque, minimum speed at minimum control current)
- End of control at $V_{g \min}$ (minimum torque, maximum permissible speed at maximum control current)

Characteristic

Note

The control oil is internally taken out of the high-pressure side of the motor (A or B). For reliable control, an operating pressure of at least 30 bar is required in A (B). If a control operation is performed at an operating pressure $< 30 \text{ bar}$, an auxiliary pressure of at least 30 bar must be applied at port G via an external check valve. For lower pressures, please contact us.

Please note that pressures up to 450 bar can occur at port G.

The following only needs to be noted for size 250:

- The beginning of control and the EP characteristic are influenced by the case pressure. An increase in case pressure causes an increase in the beginning of control (see page 5) and thus a parallel shift of the characteristic.

HA – Automatic control high-pressure related

The automatic high-pressure related control adjusts the displacement automatically depending on the operating pressure.

The displacement of the A6VE motor with HA control is $V_{g \min}$ (maximum speed and minimum torque). The control unit measures internally the operating pressure at A or B (no control line required) and upon reaching the beginning of control, the controller swivels the motor from $V_{g \min}$ to $V_{g \max}$ with increase of pressure. The displacement is modulated between $V_{g \min}$ and $V_{g \max}$, thereby depending on load conditions.

- Beginning of control at $V_{g \min}$ (minimum torque, maximum speed)
- End of control at $V_{g \max}$ (maximum torque, minimum speed)

Note

- For safety reasons, winch drives are not permissible with beginning of control at $V_{g \min}$ (standard for HA).
- The control oil is internally taken out of the high-pressure side of the motor (A or B). For reliable control, an operating pressure of at least 30 bar is required in A (B). If a control operation is performed at an operating pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port G via an external check valve. For lower pressures, please contact us.
Please note that pressures up to 450 bar can occur at port G.
- The beginning of control and the HA characteristic are influenced by the case pressure. An increase in case pressure causes an increase in the beginning of control (see page 5) and thus a parallel shift of the characteristic. Only for HA1T (sizes 28 to 160) and HA1, HA2, HA3, HA.T, (size 250).
- A leakage flow of maximum 0.3 L/min is present at port X (operating pressure $>$ pilot pressure). To avoid a build-up of pilot pressure, pressure is to be relieved from port X to the reservoir.
Only for control HA.T.

HA – Automatic control high-pressure related

HA1, HA3

With minimum pressure increase

An operating pressure increase of $\Delta p \leq$ approx. 10 bar results in an increase in displacement from 0 cm³ to $V_{g \max}$ (sizes 28 to 160) or from 0.2 $V_{g \max}$ to $V_{g \max}$ (size 250).

Beginning of control, setting range

Sizes 28 to 160 _____ 80 to 350 bar

Size 250 _____ 80 to 340 bar

Please state the desired beginning of control in plain text when ordering, e. g.: beginning of control at 300 bar.

DA – Automatic control speed-related

The variable motor A6VE with automatic speed-related control, is intended for use in hydrostatic travel drives in combination with the variable pump A4VG with DA control.

A drive-speed-related pilot pressure signal is generated by the A4VG variable pump, and that signal, together with the operating pressure, regulates the swivel angle of the hydraulic motor.

Increasing pump speed, i.e. increasing pilot pressure, causes the motor to swivel to a smaller displacement (lower torque, higher speed), depending on the operating pressure.

If the operating pressure exceeds the pressure setpoint set on the controller, the variable motor swivels to a larger displacement (higher torque, lower speed).

Pressure ratio p_{St}/p_{HD} : 3/100, 5/100

DA closed loop control is only suitable for certain types of drive systems and requires review of the engine and vehicle parameters to ensure that the motor is used correctly and that machine operation is safe and efficient. We recommend that all DA applications be reviewed by a Bosch Rexroth application engineer.

Note

The beginning of control and the DA characteristic are influenced by case pressure. An increase in case pressure causes a decrease in the beginning of control (see page 5) and thus a parallel shift of the characteristic.

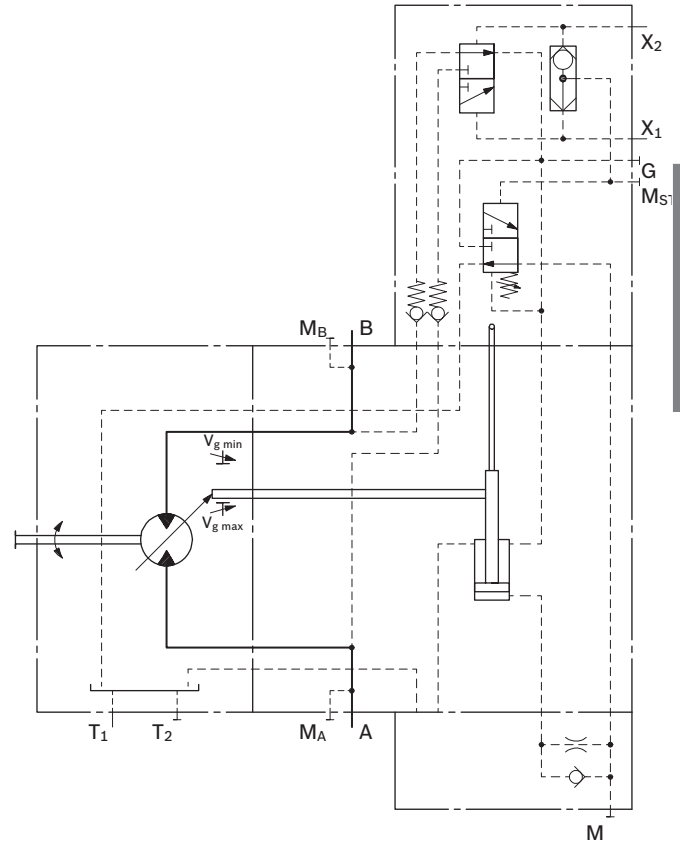

DA Hydraulic travel direction valve

Dependent on the direction of rotation (travel direction), the travel direction valve is switched by using pilot pressures connections X₁ or X₂.

Direction of rotation	Operating pressure in	Pilot pressure in
cw	A	X ₁
ccw	B	X ₂

Schematic DA

Size 250

DA – Automatic control speed-related

DA3 Electric travel direction valve + electric $V_{g \max}$ -circuit

The travel direction valve is either spring offset or switched by energizing switching solenoid a, depending on the direction of rotation (travel direction).

When the switching solenoid b is energized, the DA control is overridden and the motor swivels to maximum displacement (high torque, lower speed) (electric $V_{g \max}$ -circuit).

Technical data, solenoid a with Ø37 (travel direction valve)

Schematic DA3
Sizes 28 to 160

Electric travel direction valve (for DA)

Application in travel drives in closed circuits. The travel direction valve of the motor is actuated by an electric signal that also switches the swivel direction of the travel drive pump (e. g. A4VG with DA control valve).

If the pump in the closed circuit is switched to the neutral position or into reverse, the vehicle may experience jerky deceleration or braking, depending on the vehicle's mass and current travel speed.

When the travel direction valve of the pump (e. g. 4/3-directional valve of the DA-control) is switched to

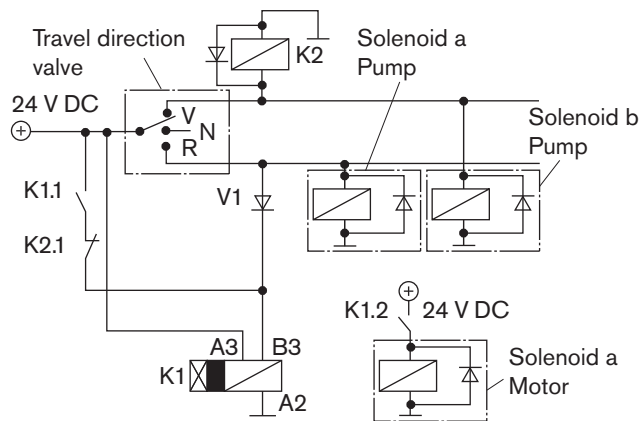

- the neutral position, the electric circuitry causes the previous signal on the travel direction valve on the motor to be retained.
- reversing, the electric circuitry causes the travel direction valve on the motor to switch to the other travel direction following a time delay (approx. 0.8 s) with respect to the pump.

As a result, jerky deceleration or braking is prevented in both cases.

DA3 control (see page 22)

Schematic - electric travel direction valve

Note

The shown diodes and relays are not included in the delivery of the motor.

- 2) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.
- 3) Only dimensions according to SAE J518, metric fastening thread is a deviation from standard.
- 4) Depending on installation position, T₁ or T₂ must be connected (see also installation instructions on page 39).
- 5) The spot face can be deeper than specified in the appropriate standard.
- 6) Must be connected for external piping. Is plugged with internal ducting.
- 7) Is plugged with external ducting. Must be connected with internal piping.
- 8) O = Must be connected (plugged on delivery)
X = Plugged (in normal operation)

Connector for solenoids

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

DEUTSCH DT04-2P-EP04

Sizes 28 to 160

Molded, 2-pin, without bidirectional suppressor diode

There is the following type of protection with mounted mating connector:

IP67 _____ DIN/EN 60529

and IP69K _____ DIN 40050-9

Circuit symbol

Mating connector

DEUTSCH DT06-2S-EP04
Bosch Rexroth Mat. No. R902601804

Consisting of: _____ DT designation

– 1 housing _____ DT06-2S-EP04

– 1 wedge _____ W2S

– 2 sockets _____ 0462-201-16141

The mating connector is not included in the delivery contents. This can be supplied by Bosch Rexroth on request.

HIRSCHMANN DIN EN 175 301-803-A/ISO 4400

Size 250

Without bidirectional suppressor diode

There is the following type of protection with mounted mating connector:

IP65 _____ DIN/EN 60529

The seal ring in the cable fitting is suitable for line diameters of 4.5 mm to 10 mm.

The HIRSCHMANN connector is included in the delivery contents of the motor.

Changing connector orientation

If necessary, you can change the connector orientation by turning the solenoid housing.

To do this, proceed as follows:

1. Loosen the mounting nut (1) of the solenoid. To do this, turn the mounting nut (1) one turn counter-clockwise.
2. Turn the solenoid body (2) to the desired orientation.
3. Retighten the mounting nut. Tightening torque: 5+1 Nm. (WAF26, 12-sided DIN 3124)

On delivery, the connector orientation may differ from that shown in the brochure or drawing.

Flushing and boost pressure valve

The flushing and boost pressure valve is used to remove heat from the hydraulic circuit.

In an open circuit, it is used only for flushing the housing.

In a closed circuit, it ensures a minimum boost pressure level in addition to the case flushing.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the case drain fluid. The hydraulic fluid, removed out of the closed circuit must be replaced by cooled hydraulic fluid from the boost pump.

The valve is mounted onto the port plate or integrated (depending on the control type and size).

Cracking pressure of pressure retaining valve

(observe when setting the primary valve)

fixed setting _____ 16 bar

Switching pressure of flushing piston Δp _____ 8 ± 1 bar

Flushing flow q_v

Orifices can be used to set the flushing flows as required.

Following parameters are based on:

$$\Delta p_{ND} = p_{ND} - p_G = 25 \text{ bar and } v = 10 \text{ mm}^2/\text{s}$$

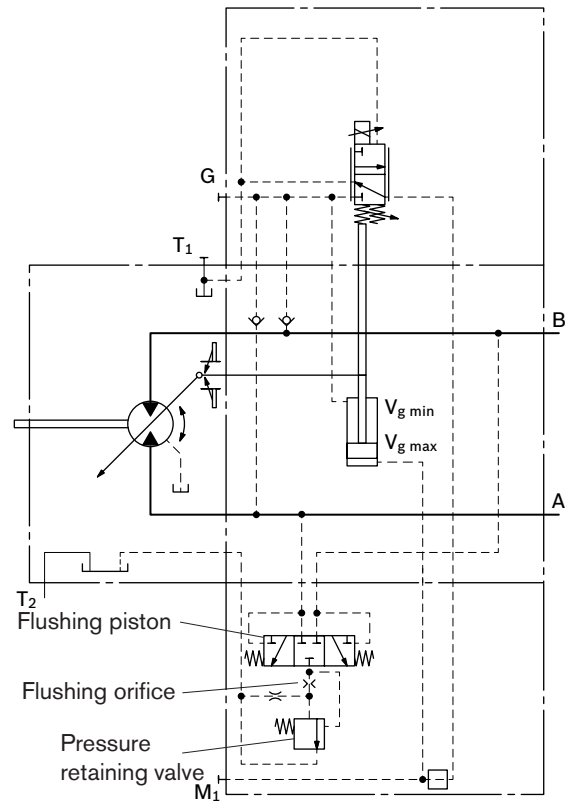

(p_{ND} = low pressure, p_G = case pressure)

Size	Flushing flow q_v [L/min]	Mat. No. of orifice
28, 55	3.5	R909651766
80	5	R909419695
107	8	R909419696
160	10	R909419697
250	10	R909419697

With sizes 28 to 160, orifices can be supplied for flushing flows from 3.5 to - 10 L/min. For other flushing flows, please state the required flushing flow when ordering. The flushing flow without orifice is approx. 12 to 14 L at low pressure $\Delta p_{ND} = 25$ bar.

Size 250

Function

Travel drive/winch counterbalance valves are designed to reduce the danger of overspeeding and cavitation of axial piston motors in open circuits. Cavitation occurs if the motor speed is greater than it should be for the given input flow while braking, travelling downhill, or lowering a load.

If the inlet pressure drops, the counterbalance spool throttles the return flow and brakes the motor until the inlet pressure returns to approx. 20 bar.

Note

- BVD available for sizes 55 to 160 and BVE available for sizes 107 and 160.
- The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set. Ordering example: A6VE80HA1T/63W-VAL38800A + BVD20F27S/41B-V03K16D0400S12
- For safety reasons, controls with beginning of control at $V_{g \min}$ (e. g. HA) are not permissible for winch drives!
- The counterbalance valve does not replace the mechanical service brake and park brake.
- Observe the detailed notes on the BVD counterbalance valve in RE 95522 and BVE counterbalance valve in RE 95525
- For the design of the brake release valve, we must know for the mechanical park brake:
 - the pressure at the start of opening
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

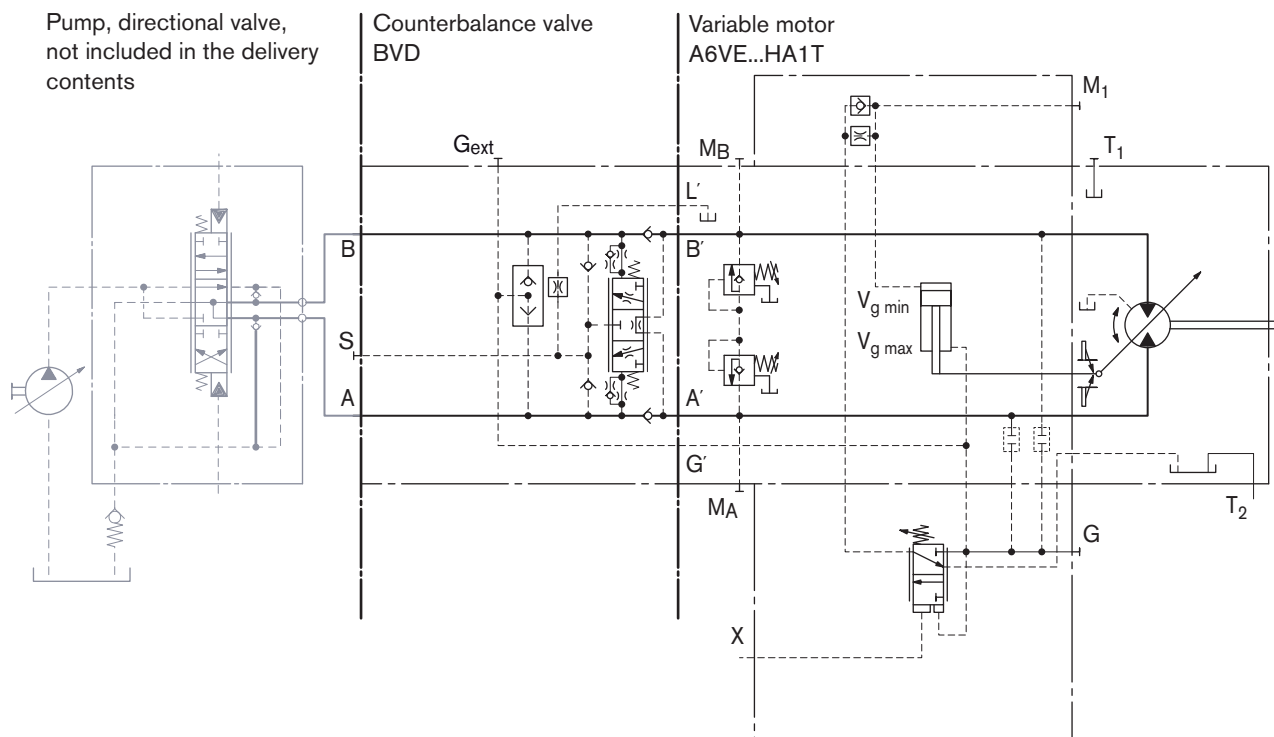

Travel drive counterbalance valve BVD...F

1) At the mounting version for the controls HD and EP, the cast-in port designations A and B on the counterbalance valve BVD do not correspond with the connection drawing of the A6VE motor.

The designation of the ports on the installation drawing of the motor is binding!

2) Observe the general instructions on page 40 for the maximum tightening torques.

3) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

4) The spot face can be deeper than specified in the appropriate standard.

5) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

Counterbalance valve BVD and BVE

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Mounting the counterbalance valve

When delivered, the counterbalance valve is mounted to the motor with two tacking screws (transport protection). The tacking screws may not be removed while mounting the service lines. If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be mounted to the motor port plate using the provided tacking screws. The counterbalance valve is finally mounted to the motor by screwing on the SAE flange with the following screws:

6 screws (1, 2, 3, 4, 5, 8) _____ length $B1+B2+B3$
 2 screws (6, 7) _____ length $B3+B4$

Tighten the screws in two steps in the specified sequence from 1 to 8 (see following scheme).

In the first step, the screws must be tightened with half the tightening torque, and in the second step with the maximum tightening torque (see following table).

Thread	Strength class	Tightening torque [Nm]
M6 x 1 (tacking screw)	10.9	15.5
M10 x 1.5	10.9	75
M12 x 1.75	10.9	130
M14 x 2	10.9	205

- 1) SAE flange
- 2) Tacking screw (M6 x 1, length = $B1 + B2$, DIN 912)

NG...plate	55...38	80...38, 107...37	107...38, 160...38
B1 ³⁾	M10 x 1.5 17 deep	M12 x 1.75 15 deep	M14 x 2 19 deep
B2	68	68	85
B3	customer-specific		
B4	M10 x 1.5 15 deep	M12 x 1.75 16 deep	M14 x 2 19 deep

3) Minimum required thread reach $1 \times \varnothing$ -thread

Counterbalance valve integrated BVI

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Function

The integrated counterbalance valve is designed to reduce the danger of overspeeding and cavitation of axial piston motors in open circuits. Cavitation occurs if the motor speed is greater than it should be for the given input flow while braking or traveling downhill.

Note

- The integrated counterbalance valve must be ordered additionally, see ordering code below.
- The counterbalance valve does not replace the mechanical service brake and park brake.
- For the design of the brake release valve, we must know for the mechanical park brake:
 - the pressure at the start of opening
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

Application options

- Track drive in excavator crawlers

Speed sensor

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Version A6VE...U ("prepared for speed sensor", i.e. without sensor) is equipped with a toothed ring on the rotary group.

On deliveries "prepared for speed sensor", the port is plugged with a pressure-resistant cover.

With the speed sensor DSA mounted, a signal proportional to motor speed can be generated. The sensor measures the speed and direction of rotation.

Ordering code, technical data, dimensions and details on the connector, plus safety instructions about the sensor can be found in the relevant data sheet (DSA – RE 95133).

The sensor is mounted on the port provided for this purpose with a mounting bolt.

We recommend ordering the A6VE variable motor complete with installed sensor.

Installation instructions

General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

The case drain fluid in the motor housing must be directed to the reservoir via the highest available drain port (T_1 , T_2).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the minimum permissible case pressure of all connected units is not exceeded in any situation. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Installation position

See the following examples 1 to 6.

Further installation positions are possible upon request.

Recommended installation positions: 1 and 2.

Note

In certain installation conditions, an influence on the control characteristics can be expected. Gravity, dead weight and case pressure can cause minor shifts in control characteristics and changes in response time.

Installation position	Air bleed	Filling
1	–	T_2 , T_1
2	–	T_2 , T_1
3	–	T_2 , T_1
4	L_1	T_2 , T_1 (L_1)
5	L_1	T_2 , T_1 (L_1)
6	L_1	T_2 , T_1 (L_1)

L_1 Filling / air bleed

T_1 , T_2 Drain port

$h_{t\ min}$ Minimum required immersion depth (200 mm)

h_{\min} Minimum required spacing to reservoir bottom (100 mm)

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

General instructions

- The motor A6VE is designed to be used in open and closed circuits.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e. g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to ISO 13849.
- The following tightening torques apply:
 - Fittings:
 - Observe the manufacturer's instruction regarding tightening torques for the fittings used.
 - Mounting bolts:
 - For mounting bolts with metric ISO threads according to DIN 13, we recommend checking the tightening torque in individual cases in accordance with VDI 2230.
 - Female threads in the axial piston unit:
 - The maximum permissible tightening torques $M_{G \max}$ are maximum values for the female threads and must not be exceeded. For values, see the following table.
 - Threaded plugs:
 - For the metallic threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs M_V apply. For values, see the following table.

Ports Standard	Size of thread	Maximum permissible tightening torque of the female threads $M_{G \max}$	Required tightening torque of the threaded plugs M_V ¹⁾	WAF hexagon socket of the threaded plugs
DIN 3852	M12 x 1.5	50 Nm	25 Nm ²⁾	6 mm
	M14 x 1.5	80 Nm	35 Nm	6 mm
	M16 x 1.5	100 Nm	50 Nm	8 mm
	M18 x 1.5	140 Nm	60 Nm	8 mm
	M22 x 1.5	210 Nm	80 Nm	10 mm
	M26 x 1.5	230 Nm	120 Nm	12 mm
	M27 x 2	330 Nm	135 Nm	12 mm
	M33 x 2	540 Nm	225 Nm	17 mm
	M42 x 2	720 Nm	360 Nm	22 mm

1) The tightening torques apply for screws in the "dry" state as received on delivery and in the "lightly oiled" state for installation.

2) In the "lightly oiled" state, the M_V is reduced to 17 Nm for M12 x 1.5.

Variable plug-in motor A6VE Series 65

- ▶ High pressure motor for integration in mechanical gearbox
- ▶ Sizes 55 to 200
- ▶ Nominal pressure 400 bar
- ▶ Maximum pressure 450 bar
- ▶ Open and closed circuits

Features

- ▶ Space-saving construction due to recessed mounting flange
- ▶ Easy to install. Simply plug into the mechanical gearbox.
- ▶ Wide control range (can be swiveled to zero)
- ▶ Approved for very high rotational speeds
- ▶ High torque
- ▶ Optional with flushing and boost-pressure valve mounted
- ▶ Optional with integrated or mounted counterbalance valve
- ▶ Bent-axis design

Notice
▶ Note the project planning notes on page 40.

4) Only for HZ7 and HA3. Supplement specification for integrated BVI counterbalance valve, see separate type code on page 30. Note the restrictions described on page 31.
5) Possible only in combination with HP, EP and HA control. Note the restrictions described on page 27.

6) Type code for counterbalance valve to be quoted separately in accordance with data sheet 95522 – BVD or 95525 – BVE). Note the restrictions described on pages 27 and 30.
7) Not for EZ7, EZ8, HZ7 and HA3
8) Specify the type code separately for sensor in accordance with data sheet 95133 – DSA and observe the requirements for the electronics.

Hydraulic fluids

The A6VE variable motor is designed for operation with HLP mineral oil according to DIN 51524. Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)
- ▶ 90223: Fire-resistant, water-containing hydraulic fluids (HFC, HFB)
- ▶ 90225: Axial piston units for operation with water-free and water-containing fire-resistant hydraulic fluids (HFDR, HFDU, HFB, HFC).

The variable motor A6VE is not suitable for operation with HFA hydraulic fluid. If operating with HFB-, HFC- and HFD or environmentally acceptable hydraulic fluids, the limitations regarding technical data or other seals must be observed.

Viscosity and temperature of hydraulic fluids

	Viscosity	Temperature	Comment
Cold start ¹⁾	$v_{\max} \leq 1600 \text{ mm}^2/\text{s}$	$\theta_{\text{St}} \geq -40 \text{ }^\circ\text{C}$	$t \leq 3 \text{ min}$, $n \leq 1000 \text{ min}^{-1}$, without load $p \leq 50 \text{ bar}$
Permissible temperature difference		$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid in the system
Warm-up phase	$v = 1600 \text{ to } 400 \text{ mm}^2/\text{s}$	$\theta = -40 \text{ }^\circ\text{C to } -25 \text{ }^\circ\text{C}$	At $p \leq 0.7 \times p_{\text{nom}}$, $n \leq 0.5 \times n_{\text{nom}}$ and $t \leq 15 \text{ min}$
Continuous operation	$v = 400 \text{ to } 10 \text{ mm}^2/\text{s}$		this corresponds, for VG 46 for example, to a temperature range of $+5 \text{ }^\circ\text{C to } +85 \text{ }^\circ\text{C}$ (see selection diagram)
		$\theta = -25 \text{ }^\circ\text{C to } +103 \text{ }^\circ\text{C}$	measured at port T Observe the permissible temperature range of the shaft seal ($\Delta T = \text{approx. } 12 \text{ K}$ between bearing/shaft seal and port T)
	$v_{\text{opt}} = 36 \text{ to } 16 \text{ mm}^2/\text{s}$		Range of optimum operating viscosity and efficiency
Short-term operation	$v_{\min} \geq 7 \text{ mm}^2/\text{s}$		$t < 3 \text{ min}$, $p < 0.3 \times p_{\text{nom}}$

1) For application cases below $-25 \text{ }^\circ\text{C}$, an NBR shaft seal is required (permissible temperature range $-40 \text{ }^\circ\text{C to } +90 \text{ }^\circ\text{C}$).

Selection diagram

Hydraulic fluids

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At very high hydraulic fluid temperatures (90 °C to maximum 103 °C, measured at port **T**), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

Effect of case pressure on beginning of control

An increase in the case pressure leads to an increase in the beginning of control for the HP and HA.T3 controls.

For EP and HA control, an increase in case pressure has no effect on the beginning of control.

The factory setting for the beginning of control is made at $p_{abs} = 2$ bar case pressure.

Flow direction

Direction of rotation, viewed on drive shaft	
clockwise	counter-clockwise
A to B	B to A

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the rotational speed of the axial piston unit and the leakage pressure in the housing (case pressure). Momentary ($t < 0.1$ s) pressure peaks of up to 10 bar are permitted. The service life of the shaft seal decreases with increasing frequency of pressure peaks and increasing mean differential pressure. The case pressure must be equal to or higher than the ambient pressure.

The FKM shaft seal ring may be used for leakage temperatures from -25 °C to +115 °C. For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

Working pressure range

Pressure at working port A or B		Definition
Nominal pressure p_{nom}	400 bar	The nominal pressure corresponds to the maximum design pressure.
Maximum pressure p_{max}	450 bar	The maximum pressure corresponds to the maximum working pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.
Single operating period	10 s	
Total operating period	300 h	
Minimum pressure (high-pressure side)	25 bar	Minimum pressure at the high-pressure side (A or B) required to prevent damage to the axial piston unit.
Minimum pressure – operation as a pump (inlet)	See diagram below	To avoid damage to the axial piston motor during operation as a pump (change of the high-pressure side at constant direction of rotation, e.g. during braking processes) a minimum pressure has to be ensured at the working port (inlet). The minimum required pressure is dependent on the rotational speed and displacement of the axial piston unit (see characteristic curve).
Summation pressure p_{Su} (pressure A + pressure B)	700 bar	The summation pressure is the sum of the pressures at the working ports (A and B).
Rate of pressure change $R_{A max}$		Maximum permissible speed of pressure build-up and reduction during a pressure change across the entire pressure range.
with built-in pressure relief valve	9000 bar/s	
without pressure relief valve	16000 bar/s	

▼ Rate of pressure change $R_{A max}$

▼ Pressure definition

Total operating period = $t_1 + t_2 + \dots + t_n$

▼ Minimum pressure – operation as a pump (inlet)

This diagram is only valid for the optimum viscosity range of $n_{opt} = 36$ to $16 \text{ mm}^2/\text{s}$.

If the above mentioned conditions cannot be ensured please contact us.

Notice

Working pressure range valid when using hydraulic fluids based on mineral oils. Values for other hydraulic fluids, please contact us.

	Port plate 6	m	kg	37	45	52	70	-

▼ Permissible displacement in relation to rotational speed

Notice

- Theoretical values, without efficiency and tolerances; values rounded
- Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, such as speed variation, reduced angular acceleration as a function of the frequency and the permissible angular acceleration at start (lower than the maximum angular acceleration) can be found in data sheet 90261.

Determining the operating characteristics

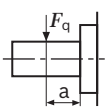

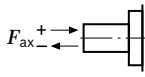

Inlet flow	$q_v = \frac{V_g \times n}{1000 \times \eta_v}$	[l/min]
Rotational speed	$n = \frac{q_v \times 1000 \times \eta_v}{V_g}$	[rpm]
Torque	$T = \frac{V_g \times \Delta p \times \eta_{hm}}{20 \times \pi}$	[Nm]
Power	$P = \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p \times \eta_t}{600}$	[kW]

Key

V_g	Displacement per revolution [cm ³]
Δp	Differential pressure [bar]
n	Rotational speed [rpm]
η_v	Volumetric efficiency
η_{hm}	Hydraulic-mechanical efficiency
η_t	Total efficiency ($\eta_t = \eta_v \times \eta_{hm}$)

- The values are applicable:
 - for the optimum viscosity range from $\nu_{\text{opt}} = 36$ to 16 mm²/s
 - with hydraulic fluid based on mineral oils
- Observe limitation of input flow due to counterbalance valve (page 27).
- Torque without radial force, with radial force see page 9.
- Values in this range on request

Permissible radial and axial forces of the drive shafts

		$- F_{ax \max}$	N	500	500	710	710	900	900	1120	1120	1250
Permissible axial force per bar working pressure		$+ F_{ax \text{ perm}/\text{bar}}$	N/bar	7.5	7.5	9.6	9.6	11.3	11.3	15.1	15.1	17.0

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

▼ **Toothed gear output drive**

- 1 “Counter-clockwise” rotation, pressure at port B
- 2 “Clockwise” rotation, pressure at port A
- 3 Bidirectional direction of rotation

Notice

- ▶ The values given are maximum values and do not apply to continuous operation.
- ▶ The permissible axial force in direction $-F_{ax}$ is to be avoided as the lifetime of the bearing is reduced.
- ▶ Special requirements apply in the case of belt drives. Please contact us.

1) With intermittent operation

HP – Proportional hydraulic control

The proportional hydraulic control provides infinite adjustment of the displacement. The control is proportional to the pilot pressure at port **X**.

HP1, HP2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed at minimum pilot pressure)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum rotational speed at maximum pilot pressure)

HP5, HP6 negative control

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum rotational speed at minimum pilot pressure).
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed, at maximum pilot pressure).

Notice

- ▶ Maximum permissible pilot pressure: $p_{st} = 100$ bar
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Bear in mind that pressures up to 450 bar can occur at port **G**.
- ▶ Specify the desired beginning of control in plain text when ordering, e.g. beginning of control at 10 bar.
- ▶ The beginning of control and the HP characteristic curve are influenced by the case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 6) and thus a parallel displacement of the characteristic curve.
- ▶ A leakage flow of maximum 0.3 l/min can occur at port **X** due to internal leakage (working pressure > pilot pressure). The control is to be suitably configured to avoid an independent build-up of pilot pressure.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 55 to 200

HP without damping.

HP.D with throttle pin on both sides, symmetrical (see table)

Optional for sizes 55 to 200

HP with throttle pin on both sides, symmetrical (see table)

▼ Throttle pin overview

Size	55	80	107	160	200
Groove size [mm]	0.45	0.45	0.55	0.55	0.65

HP1, HP5 – pilot pressure increase $\Delta p_{st} = 10$ bar

HP1 positive control

A pilot pressure increase of 10 bar at port **X** results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

HP5 negative control

A pilot pressure increase of 10 bar at port **X** results in a decrease in displacement from $V_{g \max}$ to $V_{g \min}$.
Beginning of control, setting range 2 to 20 bar
Standard setting: beginning of control at 3 bar (end of control at 13 bar)

▼ Characteristic curve

HP2, HP6 pilot pressure increase $\Delta p_{st} = 25$ bar

HP2 positive control

A pilot pressure increase of 25 bar at port **X** results in an increase in displacement from $V_{g \text{ min}}$ to $V_{g \text{ max}}$.

HP6 negative control

A pilot pressure increase of 25 bar at port **X** results in a decrease in displacement from $V_{g \text{ max}}$ to $V_{g \text{ min}}$.

Beginning of control, setting range 5 to 35 bar

Standard setting:

beginning of control at 10 bar (end of control at 35 bar)

▼ **Characteristic curve**

▼ **Circuit diagram HP5, HP6 (negative control)**

▼ **Circuit diagram HP1, HP2 (positive control)**

HP5D1, HP6D1 Pressure control, fixed setting

The pressure control overrides the HP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger angle.

The increase in displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve 80 to 400 bar

▼ **Circuit diagram HP5D1, HP6D1 (negative control)**

EP – Proportional control, electric

The proportional electric control provides infinite adjustment of the displacement. Control is proportional to the electric control current applied to the solenoid.

EP1, EP2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed at minimum control current)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum rotational speed at maximum control current)

EP5, EP6 negative control

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum rotational speed at minimum control current)
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed at maximum control current)

▼ Characteristic curve

Notice

The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us.

Bear in mind that pressures up to 450 bar can occur at port **G**.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 55 to 200

EP without damping.

EP.D with throttle pin on both sides, symmetrical (see table)

Optional for sizes 55 to 200

EP with throttle pin on both sides, symmetrical (see table)

▼ Circuit diagram EP5, EP6 (negative control)

EP5D1, EP6D1 Pressure control, fixed setting

The pressure control overrides the EP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger angle.

The increase in displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve 80 to 400 bar

▼ Circuit diagram EP5D1, EP6D1 (negative control)

HZ – Two-point control, hydraulic

The two-point hydraulic control allows the displacement to be set to either $V_{g \min}$ or $V_{g \max}$ by switching the pilot pressure at port **X** on or off.

HZ5, HZ7 negative control

- ▶ Position at $V_{g \max}$ (without pilot pressure, maximum torque, minimum rotational speed)
- ▶ Position at $V_{g \min}$ (with pilot pressure > 15 bar activated, minimum torque, maximum permissible rotational speed)

▼ Characteristic curve HZ5, HZ7

Notice

- ▶ Maximum permissible pilot pressure: 100 bar
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar required in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Bear in mind that pressures up to 450 bar can occur at port **G**.
- ▶ A leakage flow of maximum 0.3 l/min occurs at port **X** (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure must be relieved from port **X** to the reservoir.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 160 and 200

HZ5 with throttle pin on both sides, symmetrical (see table)

Standard for sizes 107 and 160 with BVI

HZ7 with throttle pin on both sides 0.30, symmetrical

Standard for sizes 55 to 107

HZ7 (synchronous piston) with throttle pin on both sides, symmetrical (see table)

EZ – Two-point control, electric

The two-point electric control allows the displacement to be set to either $V_{g \min}$ or $V_{g \max}$ by switching the electric current to a switching solenoid on or off.

Notice

The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us.

Bear in mind that pressures up to 450 bar can occur at port **G**.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 160 and 200

EZ5, EZ6 with throttle pin on both sides, symmetrical (see table)

HA – Automatic high-pressure related control

The automatic high-pressure related control adjusts the displacement automatically depending on the working pressure.

The beginning of control of the A6VE motor with HA control is $V_{g\ min}$ (maximum rotational speed and minimum torque). The control device measures internally the working pressure at **A** or **B** (no control line required) and upon reaching the beginning of control, the controller swivels the motor from $V_{g\ min}$ to $V_{g\ max}$. The displacement is modulated between $V_{g\ min}$ and $V_{g\ max}$ depending on the load.

HA1, HA2, HA3 positive control

- ▶ Beginning of control at $V_{g\ min}$ (minimum torque, maximum rotational speed)
- ▶ End of control at $V_{g\ max}$ (maximum torque, minimum rotational speed)

Notice

- ▶ For safety reasons, winch drives are not permissible with beginning of control at $V_{g\ min}$ (standard for HA).
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Bear in mind that pressures up to 450 bar can occur at port **G**.
- ▶ The beginning of control and the HA.T3 characteristic curve are influenced by case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 6) and thus a parallel displacement of the characteristic curve.
- ▶ A leakage flow of maximum 0.3 l/min occurs at port **X** (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure must be relieved from port **X** to the reservoir. Only for HA.T control.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 55 to 200

HA1,2 with one-sided throttle pin, throttling occurs from $V_{g\ min}$ to $V_{g\ max}$. (see table) HA3 and HA3T3 with BVI and throttle pin on both sides, 0.30, symmetrical

HA1, HA3 with minimum pressure increase, positive control

A working pressure increase of $\Delta p \leq$ approx. 10 bar results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.
Beginning of control, setting range 80 to 350 bar
Specify the desired beginning of control in plain text when ordering, e.g. beginning of control at 300 bar.

▼ **Characteristic curve HA1, HA3**

HA2 with pressure increase, positive control

A working pressure increase of $\Delta p \leq$ approx. 100 bar results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.
Beginning of control, setting range 80 to 350 bar
Specify the desired beginning of control in plain text when ordering, e.g. beginning of control at 200 bar.

▼ **Characteristic curve HA2**

▼ **Circuit diagram HA1**

▼ **Circuit diagram HA2**

▼ **Circuit diagram HA3**

With integrated BVI counterbalance valve, see page 32

HA.T3 override, hydraulic, remote controlled, proportional

With the HA.T3 control, the beginning of control can be influenced by applying a pilot pressure to port **X**. For each 1 bar of pilot pressure increase, the beginning of control is reduced by 17 bar.

Beginning of control setting	300 bar	300 bar
Pilot pressure at port X	0 bar	10 bar
Beginning of control at	300 bar	130 bar

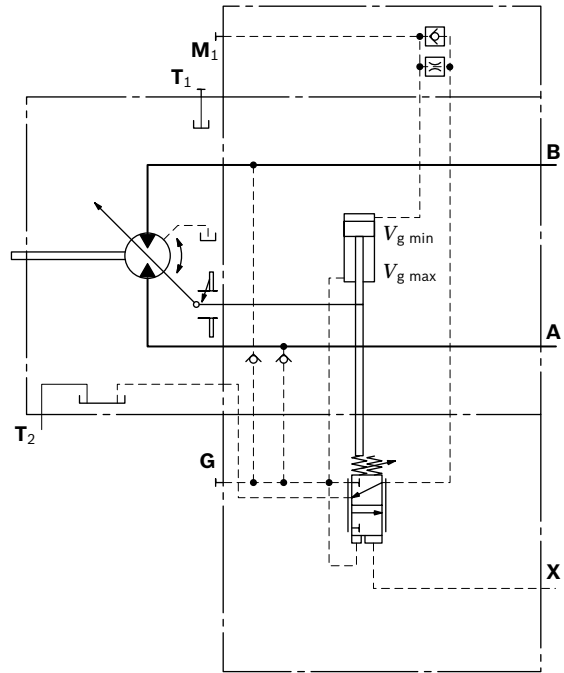

Notice

Maximum permissible pilot pressure 100 bar.

Connector for solenoids

DEUTSCH DT04-2P-EP04

Molded connector, 2-pin, without bidirectional suppressor diode

The following type of protection results with the installed mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

▼ Circuit symbol

▼ Mating connector DEUTSCH DT06-2S-EP04

Consisting of	DT designation
1 housing	DT06-2S-EP04
1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery. This can be supplied by Bosch Rexroth on request (material number R902601804).

Notice

- ▶ If necessary, you can change the position of the connector by turning the solenoid.
- ▶ The procedure is defined in the instruction manual.

Flushing and boost-pressure valve

The flushing and boost-pressure valve is used to remove heat from the hydraulic circuit.

In a closed circuit, it is used for flushing the case and safeguarding the minimum boost pressure.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the leakage. In the closed circuit, the removed hydraulic fluid must be replaced by cooled hydraulic fluid supplied by the boost pump.

The valve is mounted on the port plate or integrated (depending on the control type and size).

Cracking pressure of pressure retaining valve

(observe when setting the primary valve)

- ▶ Size 55 to 200, fixed setting 16 bar

Switching pressure of flushing spool Δp

- ▶ Size 55 to 107 (small flushing valve) 8 ± 1 bar
- ▶ Size 107 to 200 (medium and large flushing valve) 17.5 ± 1.5 bar

Flushing flow q_v

Orifices can be used to adjust the flushing flows as required. The following parameters are based on:

$$\Delta p_{ND} = p_{ND} - p_G = 25 \text{ bar and } v = 10 \text{ mm}^2/\text{s}$$

(p_{ND} = low pressure, p_G = case pressure)

The countersink can be deeper than as specified in the standard.

BVD and BVE counterbalance valves

Function

Counterbalance valves for travel drives and winches should reduce the danger of overspeed and cavitation in open circuits of axial piston motors. Cavitation occurs if, during braking, when going downhill or during the load-lowering process, the motor speed is greater than it should be for the given inlet flow and thus the supply pressure collapses. If the supply pressure falls below the value specified for the relevant counterbalance valve, the counterbalance spool moves into the closed position. The cross-sectional area of the counterbalance valve return duct is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor reaches the specified value for the given inlet flow.

Notice

- ▶ BVD available for sizes 55 to 200 and BVE available for sizes 107 to 200.
- ▶ The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set.
Order example: A6VE080HA1T30004A/65MWV0Y2Z 97W0-0 + BVD20F27S/41B-V03K16D0400S12

- ▶ For safety reasons, controls with beginning of control at $V_{g \min}$ (e.g. HA) are not permissible for winch drives!
- ▶ Counterbalance valves must be optimized during prototype commissioning to prevent unacceptable operating conditions and compliance with the specification must be verified.
- ▶ The counterbalance valve does not replace the mechanical service brake and holding brake.
- ▶ Observe the detailed notes on the BVD counterbalance valve in RE 95522 and BVE counterbalance valve in RE 95525.
- ▶ For the design of the brake release valve, we require the following data for the mechanical holding brake:
 - the cracking pressure
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

Mounting of the counterbalance valve

When delivered, the counterbalance valve is fastened to the motor with two tacking screws (transport lock). The tacking screws may not be removed while mounting the working lines! If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be fastened to the motor port plate using the provided tacking screws.

The counterbalance valve is finally mounted to the motor by fitting the SAE flange

The screws to be used and the instructions for mounting can be found in the instruction manual.

1) Pressure relief valve

2) Counterbalance valve, dual action

3) Counterbalance valve, single action

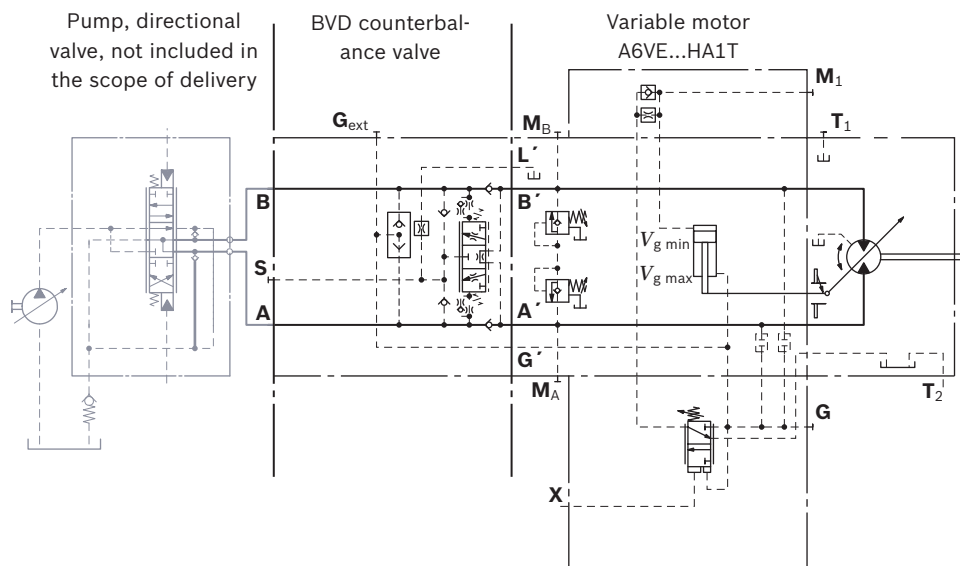

Counterbalance valve for travel drive BVD...F

Application option

- ▶ Travel drives for wheeled excavators (BVD and BVE)

▼ Example circuit diagram for travel drive on wheeled excavators

1) At the mounting version for the controls HP5, HP6 and EP5, EP6, the cast-in port designation **A** and **B** on the BVD/BVE counterbalance valve do not correspond with the connection designation of the A6VE motor.
The designation of the ports on the installation drawing of the motor is binding!

2) Depending on the application, momentary pressure peaks can occur. Keep this in mind when selecting measuring devices and fittings.
3) The countersink can be deeper than as specified in the standard.
4) O = Must be connected (plugged on delivery)
X = Plugged (in normal operation)

Integrated BVI counterbalance valve

Function

The integrated counterbalance valves for track drives in excavator crawlers should reduce the danger of overspeed and cavitation of axial piston motors in open circuits. Cavitation occurs if, during braking or driving downhill, the rotational speed of the motor is greater than it should be for the given inlet flow, causing the supply pressure to fall sharply.

If the supply pressure falls below the value specified for the relevant counterbalance valve, the counterbalance spool moves into the closed position. The cross-sectional area of the counterbalance valve return duct is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor reaches the specified value for the given inlet flow.

Notice

- ▶ BVI available for sizes 107 and 160.
- ▶ The counterbalance valve must be ordered additionally. Order example: A6VE107HA3T30004A/65MWV0S2Z 96Y0-0 + BVI510008001-0
- ▶ Counterbalance valves must be optimized during prototype commissioning to prevent unacceptable operating conditions and compliance with the specification must be verified.
- ▶ The counterbalance valve does not replace the mechanical service brake and holding brake.
- ▶ For the design of the brake release valve, we require the following data for the mechanical holding brake:
 - the cracking pressure
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

- 1) Only dimensions according to SAE J518, metric fastening thread is a deviation from the standard
- 2) Depending on the application, momentary pressure peaks can occur. Keep this in mind when selecting measuring devices and fittings.
- 3) Depending on installation position, **T₁** or **T₂** must be connected (see also installation instructions on page 38).
- 4) The countersink can be deeper than as specified in the standard.

- 5) O = Must be connected (plugged when delivered)
X = Plugged (in normal operation)
- 6) Must be connected for external piping. Is plugged for internal channel routing.
- 7) Is plugged for external channel routing. Must be connected for internal piping.

Speed sensor

The A6VE...U version ("prepared for speed sensor", i.e. without sensor) is equipped with a spline on the rotary group.

A signal proportional to the rotational speed of the motor can be generated with the mounted DSA speed sensor.

The DSA sensor registers the rotational speed and direction of rotation.

Type code, technical data, dimensions and parameters for the connector, plus safety instructions about the sensor can be found in the relevant data sheet 95133 – DSA. The sensor is mounted on the port provided specially for this with a mounting bolt. On deliveries without sensor, the port is plugged with a pressure-resistant cover.

We recommend ordering the A6VE variable motor complete with mounted sensor.

Installation instructions

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit may empty via the hydraulic lines.

The leakage in the housing area must be directed to the reservoir via the highest drain port (**T₁**, **T₂**).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the maximum permissible case pressure of all connected units is not exceeded at any operational conditions. If this is not possible, separate drain lines must be laid.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Notice

In certain installation positions, an influence on the control or closed loop control can be expected. Gravity, dead weight and case pressure can cause minor characteristic shifts and changes in response time.

Key	
F	Filling / air bleeding
T₁, T₂	Drain port
$h_{t\ min}$	Minimum required immersion depth (200 mm)
h_{min}	Minimum required distance to reservoir bottom (100 mm)

Installation position

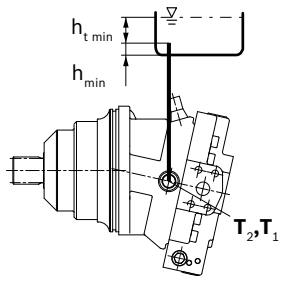

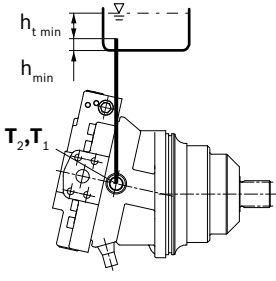

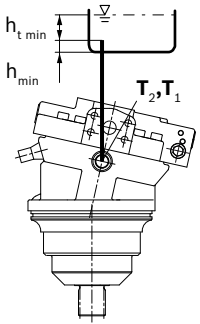

See the following examples **1** to **6**.

Further installation positions are available upon request.

Recommended installation position: **1** and **2**

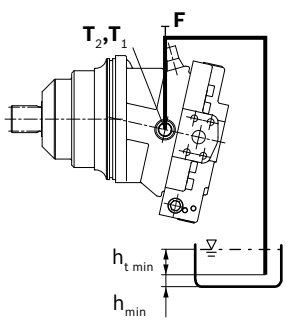

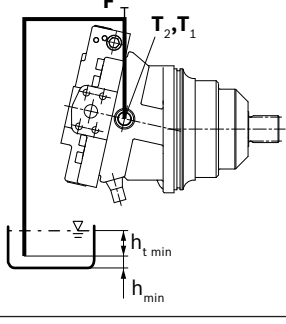

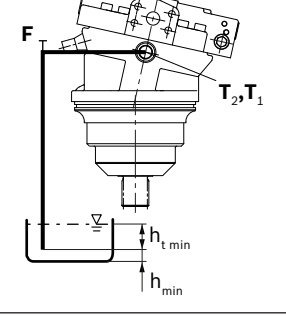

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir and below the minimum fluid level of the reservoir.

Installation position	Air bleed	Filling
1 		T₂, T₁
2 		T₂, T₁
3 		T₂, T₁

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Installation position	Air bleed	Filling
<p>4</p> 	F	T₂, T₁ (F)
<p>5</p> 	F	T₂, T₁ (F)
<p>6</p> 	F	T₂, T₁ (F)

Notice

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

Project planning notes

- ▶ The motor A6VE is designed to be used in open and closed circuits.
- ▶ The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified skilled personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes contained herein must be observed.
- ▶ For safety reasons, controls with beginning of control at $V_{g \text{ min}}$ (e.g. HA) are not permissible for winch drives, e.g. anchor winches.
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or the instruction manual.
- ▶ Not all versions of the product are approved for use in a safety function according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. When a direct current is applied, solenoids do not cause electromagnetic interference nor is their operation impaired by electromagnetic interference.
Other behavior can result when a modulated direct current (e.g. PWM signal) is applied. Potential electromagnetic interference for persons (e.g. persons with a pacemaker) and other components must be tested by the machine manufacturer.
- ▶ Please note the details regarding the tightening torques of port threads and other threaded joints in the instruction manual.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports are only intended to accommodate hydraulic lines.

Safety instructions

- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve pistons) can, under certain circumstances get stuck in position as a result of contamination (e.g. impure hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filter) will not rule out a fault but merely reduce the risk.
The machine/system manufacturer must test whether remedial measures are needed on the machine for the application concerned in order to set the consumer being driven to a safe position (e.g. safe stop) and if necessary to ensure it is properly implemented.
- ▶ Moving parts in high-pressure relief valves may in certain circumstances become stuck in an undefined position due to contamination (e.g. contaminated hydraulic fluid). This can result in restriction or loss of the load holding function in lifting winches.
The machine/system manufacturer must check whether additional measures are required on the machine for the relevant application in order to keep the load in a safe position and ensure they are properly implemented.
- ▶ When using the axial piston motor in winch drives, make certain that the technical limit values are not exceeded under all operating conditions. If the axial piston motor is extremely overloaded (e.g. if the maximum permissible rotational speeds are exceeded during weighing of the anchor while the ship is in motion), the rotary group may be damaged and, in the worst case, the axial piston motor may burst. The machine manufacturer / system manufacturer is to undertake additional measures, up to and including encapsulation.

Variable plug-in motor A6VE Series 71

- ▶ High pressure motor for integration in mechanical gearbox
- ▶ Sizes 60 to 215
- ▶ Nominal pressure 450 bar
- ▶ Maximum pressure 500 bar
- ▶ Open and closed circuits

Features

- ▶ Space-saving construction due to recessed mounting flange
- ▶ Easy to install. Simply plug into the mechanical gearbox.
- ▶ Approved for very high rotational speeds
- ▶ High starting efficiency
- ▶ Excellent slow-running characteristics
- ▶ Wide control range (can be swiveled to zero)
- ▶ High torque
- ▶ Optional with flushing and boost-pressure valve mounted
- ▶ Optional with integrated or mounted counterbalance valve
- ▶ Bent-axis design

Notice
▶ Note the project planning notes on page 40.

4) Only for HZ7 and HA3. Supplement specification for integrated BVI counterbalance valve, see separate type code on page 30. Note the restrictions described on page 31.
5) Possible only in combination with HP, EP and HA control. Note the restrictions described on page 27.

6) Type code for counterbalance valve to be quoted separately in accordance with data sheet 95522 – BVD or 95525 – BVE. Note the restrictions described on pages 27 and 30.
7) Not for EZ7, EZ8, HZ7 and HA3
8) Specify type code of sensor in accordance with data sheet 95133 – DSA separately and observe the requirements for the electronics.

Hydraulic fluids

The A6VE variable motor is designed for operation with HLP mineral oil according to DIN 51524. Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)
- ▶ 90223: Fire-resistant, water-containing hydraulic fluids (HFC, HFB)
- ▶ 90225: Axial piston units for operation with water-free and water-containing fire-resistant hydraulic fluids (HFDR, HFDU, HFB, HFC).

The variable motor A6VE is not suitable for operation with HFA hydraulic fluid. If operating with HFB-, HFC- and HFD or environmentally acceptable hydraulic fluids, the limitations regarding technical data or other seals must be observed.

Viscosity and temperature of hydraulic fluids

	Viscosity	Temperature	Comment
Cold start ¹⁾	$v_{\max} \leq 1600 \text{ mm}^2/\text{s}$	$\theta_{\text{St}} \geq -40 \text{ }^\circ\text{C}$	$t \leq 3 \text{ min}$, $n \leq 1000 \text{ min}^{-1}$, without load $p \leq 50 \text{ bar}$
Permissible temperature difference		$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid in the system
Warm-up phase	$v = 1600 \text{ to } 400 \text{ mm}^2/\text{s}$	$\theta = -40 \text{ }^\circ\text{C to } -25 \text{ }^\circ\text{C}$	At $p \leq 0.7 \times p_{\text{nom}}$, $n \leq 0.5 \times n_{\text{nom}}$ and $t \leq 15 \text{ min}$
Continuous operation	$v = 400 \text{ to } 10 \text{ mm}^2/\text{s}$		this corresponds, for VG 46 for example, to a temperature range of $+5 \text{ }^\circ\text{C}$ to $+85 \text{ }^\circ\text{C}$ (see selection diagram)
		$\theta = -25 \text{ }^\circ\text{C to } +103 \text{ }^\circ\text{C}$	measured at port T Observe the permissible temperature range of the shaft seal ($\Delta T = \text{approx. } 12 \text{ K}$ between bearing/shaft seal and port T)
	$v_{\text{opt}} = 36 \text{ to } 16 \text{ mm}^2/\text{s}$		Range of optimum operating viscosity and efficiency
Short-term operation	$v_{\min} \geq 7 \text{ mm}^2/\text{s}$		$t < 3 \text{ min}$, $p < 0.3 \times p_{\text{nom}}$

1) For application cases below $-25 \text{ }^\circ\text{C}$, an NBR shaft seal is required (permissible temperature range $-40 \text{ }^\circ\text{C}$ to $+90 \text{ }^\circ\text{C}$)

▼ Selection diagram

Notes on selection of hydraulic fluid

The hydraulic fluid should be selected such that the operating viscosity in the operating temperature range is within the optimum range (v_{opt} see selection diagram).

Notice

At no point of the component may the temperature be higher than $115 \text{ }^\circ\text{C}$. The temperature difference specified in the table is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend the use of a flushing and boost-pressure valve (see page 25).

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At very high hydraulic fluid temperatures (90 °C to maximum 103 °C, measured at port **T**), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

Effect of case pressure on beginning of control

An increase in the case pressure leads to an increase in the beginning of control for the HP and HA.T3 controls.

For EP and HA control, an increase in case pressure has no effect on the beginning of control.

The factory setting for the beginning of control is made at $p_{abs} = 2$ bar case pressure.

Flow direction

Direction of rotation, viewed on drive shaft	
clockwise	counter-clockwise
A to B	B to A

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the rotational speed of the axial piston unit and the leakage pressure in the housing (case pressure). Momentary ($t < 0.1$ s) pressure peaks of up to 10 bar are permitted. The service life of the shaft seal decreases with increasing frequency of pressure peaks and increasing mean differential pressure. The case pressure must be equal to or higher than the ambient pressure.

The FKM shaft seal ring may be used for leakage temperatures from -25 °C to +115 °C. For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

Working pressure range

Pressure at working port A or B		Definition
Nominal pressure p_{nom}	450 bar	The nominal pressure corresponds to the maximum design pressure.
Maximum pressure p_{max}	500 bar	The maximum pressure corresponds to the maximum working pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.
Single operating period	10 s	
Total operating period	300 h	
Minimum pressure (high-pressure side)	25 bar	Minimum pressure at the high-pressure side (A or B) required to prevent damage to the axial piston unit.
Minimum pressure – operation as a pump (inlet)	See diagram below	To avoid damage to the axial piston motor during operation as a pump (change of the high-pressure side at constant direction of rotation, e.g. during braking processes) a minimum pressure has to be ensured at the working port (inlet). The minimum required pressure is dependent on the rotational speed and displacement of the axial piston unit (see characteristic curve).
Summation pressure p_{Su} (pressure A + pressure B)	700 bar	The summation pressure is the sum of the pressures at the working ports (A and B).
Rate of pressure change $R_{A max}$		Maximum permissible speed of pressure build-up and reduction during a pressure change across the entire pressure range.
with built-in pressure relief valve	9000 bar/s	
without pressure relief valve	16000 bar/s	

▼ Rate of pressure change $R_{A max}$

▼ Pressure definition

Total operating period = $t_1 + t_2 + \dots + t_n$

▼ Minimum pressure – operation as a pump (inlet)

This diagram is only valid for the optimum viscosity range of $n_{opt} = 36$ to $16 \text{ mm}^2/\text{s}$.

If the above mentioned conditions cannot be ensured please contact us.

Notice

Working pressure range valid when using hydraulic fluids based on mineral oils. Values for other hydraulic fluids, please contact us.

Technical data

Size		NG	60	85	115	170	215

	With BVI	m	kg	37	45	52	70	-

▼ Permissible displacement in relation to rotational speed

Notice

- ▶ Theoretical values, without efficiency and tolerances; values rounded
- ▶ Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, such as speed variation, reduced angular acceleration as a function of the frequency and the permissible angular acceleration at start (lower than the maximum angular acceleration) can be found in data sheet 90261.

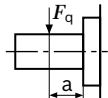

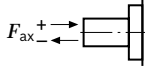

Determining the operating characteristics		
Inlet flow	$q_v = \frac{V_g \times n}{1000 \times \eta_v}$	[l/min]
Rotational speed	$n = \frac{q_v \times 1000 \times \eta_v}{V_g}$	[rpm]
Torque	$T = \frac{V_g \times \Delta p \times \eta_{hm}}{20 \times \pi}$	[Nm]
Power	$P = \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p \times \eta_t}{600}$	[kW]

Key

- V_g Displacement per revolution [cm³]
- Δp Differential pressure [bar]
- n Rotational speed [rpm]
- η_v Volumetric efficiency
- η_{hm} Hydraulic-mechanical efficiency
- η_t Total efficiency ($\eta_t = \eta_v \times \eta_{hm}$)

- The values are applicable:
 - for the optimum viscosity range from $\nu_{\text{opt}} = 36$ to $16 \text{ mm}^2/\text{s}$
 - with hydraulic fluid based on mineral oils
- Observe limitation of input flow due to counterbalance valve (page 27).
- Torque without radial force, with radial force see page 9.
- Values in this range on request

Permissible radial and axial forces of the drive shafts

Size	NG		60	85	115	170	215	
Drive shaft			W35	W40	W40	W45	W50	
Maximum radial force ¹⁾ at distance a (from shaft collar)		$F_{q \max}$	N	10266	12323	16727	21220	25016
		a	mm	20.0	22.5	22.5	25.0	27.5
Maximum torque at $F_{q \max}$	$T_{q \max}$	Nm	444	610	828	1200	1550	
Maximum differential pressure at $V_{g \max}$ and $F_{q \max}$	$\Delta p_{q \max}$	bar	450	450	450	440	450	
Maximum axial force, at standstill or depressurized operation		$+ F_{ax \max}$	N	0	0	0	0	0
		$- F_{ax \max}$	N	500	710	900	1120	1250
Permissible axial force per bar working pressure	$+ F_{ax \text{ perm}/\text{bar}}$	N/bar	7.5	9.6	11.3	15.1	17.0	

Effect of radial force F_q on the service life of bearings

By selecting a suitable direction of radial force F_q , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

▼ **Toothed gear output drive**

- 1 "Counter-clockwise" rotation, pressure at port B
- 2 "Clockwise" rotation, pressure at port A
- 3 Bidirectional direction of rotation

Notice

- ▶ The values given are maximum values and do not apply to continuous operation.
- ▶ The permissible axial force in direction $-F_{ax}$ is to be avoided as the lifetime of the bearing is reduced.
- ▶ Special requirements apply in the case of belt drives. Please contact us.

1) With intermittent operation

HP – Proportional hydraulic control

The proportional hydraulic control provides infinite adjustment of the displacement. The control is proportional to the pilot pressure at port **X**.

HP1, HP2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed at minimum pilot pressure)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum rotational speed at maximum pilot pressure)

HP5, HP6 negative control

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum rotational speed at minimum pilot pressure).
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed, at maximum pilot pressure).

Notice

- ▶ Maximum permissible pilot pressure: $p_{st} = 100$ bar
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us.

Bear in mind that pressures up to 500 bar can occur at port **G**.

- ▶ Specify the desired beginning of control in plain text when ordering, e.g. beginning of control at 10 bar.
- ▶ The beginning of control and the HP characteristic curve are influenced by the case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 6) and thus a parallel displacement of the characteristic curve.
- ▶ A leakage flow of maximum 0.3 l/min can occur at port **X** due to internal leakage (working pressure > pilot pressure). The control is to be suitably configured to avoid an independent build-up of pilot pressure.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 60 to 215

HP without damping.

HP.D with throttle pin on both sides, symmetrical (see table)

Optional for sizes 60 to 215

HP with throttle pin on both sides, symmetrical (see table)

▼ Throttle pin overview

Size	060	085	115	170	215
Groove size [mm]	0.45	0.45	0.55	0.55	0.65

HP1, HP5 – pilot pressure increase $\Delta p_{st} = 10$ bar

HP1 positive control

A pilot pressure increase of 10 bar at port **X** results in an increase in displacement from $V_{g \min}$ to $V_{g \max}$.

HP5 negative control

A pilot pressure increase of 10 bar at port **X** results in a decrease in displacement from $V_{g \max}$ to $V_{g \min}$.

Beginning of control, setting range 2 to 20 bar

Standard setting:

beginning of control at 3 bar (end of control at 13 bar)

▼ Characteristic curve

HP2, HP6 pilot pressure increase $\Delta p_{st} = 25$ bar

HP2 positive control

A pilot pressure increase of 25 bar at port **X** results in an increase in displacement from $V_{g\ min}$ to $V_{g\ max}$.

HP6 negative control

A pilot pressure increase of 25 bar at port **X** results in a decrease in displacement from $V_{g\ max}$ to $V_{g\ min}$.

Beginning of control, setting range 5 to 35 bar

Standard setting: beginning of control at 10 bar (end of control at 35 bar)

▼ **Characteristic curve**

▼ **Circuit diagram HP5, HP6 (negative control)**

▼ **Circuit diagram HP1, HP2 (positive control)**

HP5D1, HP6D1 Pressure control, fixed setting

The pressure control overrides the HP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger angle.

The increase in displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve 80 to 450 bar

▼ **Circuit diagram HP5D1, HP6D1 (negative control)**

EP – Proportional control, electric

The proportional electric control provides infinite adjustment of the displacement. Control is proportional to the electric control current applied to the solenoid.

EP1, EP2 positive control

- ▶ Beginning of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed at minimum control current)
- ▶ End of control at $V_{g \max}$ (maximum torque, minimum rotational speed at maximum control current)

EP5, EP6 negative control

- ▶ Beginning of control at $V_{g \max}$ (maximum torque, minimum rotational speed at minimum control current)
- ▶ End of control at $V_{g \min}$ (minimum torque, maximum permissible rotational speed at maximum control current)

▼ Characteristic curve

Notice

The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us.

Bear in mind that pressures up to 500 bar can occur at port **G**.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 60 to 215

EP without damping.

HA – Automatic high-pressure related control

The automatic high-pressure related control adjusts the displacement automatically depending on the working pressure.

The beginning of control of the A6VE motor with HA control is $V_{g\ min}$ (maximum rotational speed and minimum torque). The control device measures internally the working pressure at **A** or **B** (no control line required) and upon reaching the beginning of control, the controller swivels the motor from $V_{g\ min}$ to $V_{g\ max}$. The displacement is modulated between $V_{g\ min}$ and $V_{g\ max}$ depending on the load.

HA1, HA2, HA3 positive control

- ▶ Beginning of control at $V_{g\ min}$ (minimum torque, maximum rotational speed)
- ▶ End of control at $V_{g\ max}$ (maximum torque, minimum rotational speed)

Notice

- ▶ For safety reasons, winch drives are not permissible with beginning of control at $V_{g\ min}$ (standard for HA).
- ▶ The control oil is internally taken out of the high pressure side of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is required in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Bear in mind that pressures up to 500 bar can occur at port **G**.
- ▶ The beginning of control and the HA.T3 characteristic curve are influenced by case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 6) and thus a parallel displacement of the characteristic curve.
- ▶ A leakage flow of maximum 0.3 l/min occurs at port **X** (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure must be relieved from port **X** to the reservoir. Only for HA.T control.

Response time damping

The response time damping impacts the pivot behavior of the motor and consequently the machine response speed.

Standard for sizes 60 to 215

HA1,2 with one-sided throttle pin, throttling occurs from $V_{g\ min}$ to $V_{g\ max}$. (see table) HA3 and HA3T3 with BVI and throttle pin on both sides, 0.30, symmetrical

HA1, HA3 with minimum pressure increase, positive control

A working pressure increase of $\Delta p \leq$ approx. 10 bar results in an increase in displacement from $V_{g \text{ min}}$ to $V_{g \text{ max}}$.
 Beginning of control, setting range 80 to 350 bar
 Specify the desired beginning of control in plain text when ordering, e.g. beginning of control at 300 bar.

▼ **Characteristic curve HA1, HA3**

▼ **Circuit diagram HA1**

▼ **Circuit diagram HA3**

With integrated BVI counterbalance valve, see page 32

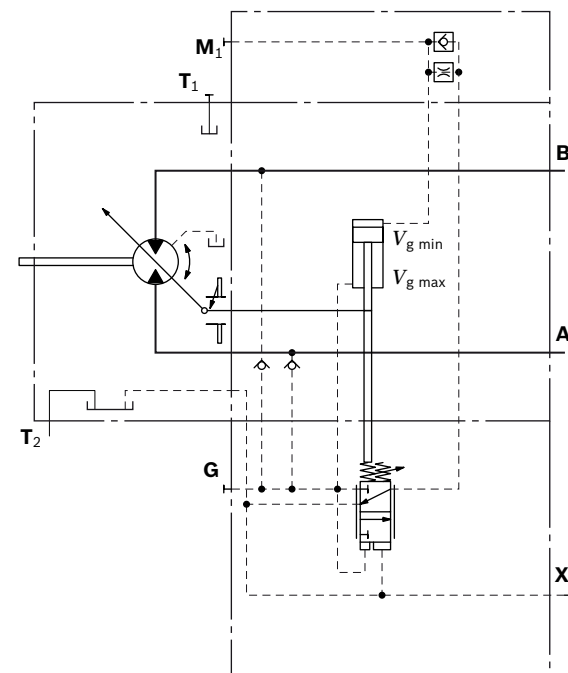

HA2 with pressure increase, positive control

A working pressure increase of $\Delta p \leq$ approx. 100 bar results in an increase in displacement from $V_{g \text{ min}}$ to $V_{g \text{ max}}$.
 Beginning of control, setting range 80 to 350 bar
 Specify the desired beginning of control in plain text when ordering, e.g. beginning of control at 200 bar.

▼ **Characteristic curve HA2**

▼ **Circuit diagram HA2**

HA.T3 override, hydraulic, remote controlled, proportional

With the HA.T3 control, the beginning of control can be influenced by applying a pilot pressure to port **X**.

For each 1 bar of pilot pressure increase, the beginning of control is reduced by 17 bar.

Beginning of control setting	300 bar	300 bar
Pilot pressure at port X	0 bar	10 bar
Beginning of control at	300 bar	130 bar

Notice

Maximum permissible pilot pressure 100 bar.

Connector for solenoids

DEUTSCH DT04-2P-EP04

Molded connector, 2-pin, without bidirectional suppressor diode

The following type of protection ensues with the installed mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

▼ Circuit symbol

▼ Mating connector DEUTSCH DT06-2S-EP04

Consisting of	DT designation
1 housing	DT06-2S-EP04
1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery. This can be supplied by Bosch Rexroth on request (material number R902601804).

Notice

- ▶ If necessary, you can change the position of the connector by turning the solenoid.
- ▶ The procedure is defined in the instruction manual.

Flushing and boost-pressure valve

The flushing and boost-pressure valve is used to remove heat from the hydraulic circuit.

In a closed circuit, it is used for flushing the case and safeguarding the minimum boost pressure.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the leakage. In the closed circuit, the removed hydraulic fluid must be replaced by cooled hydraulic fluid supplied by the boost pump.

The valve is mounted on the port plate or integrated (depending on the control type and size).

Cracking pressure of pressure retaining valve

(observe when setting the primary valve)

- Size 60 to 215, fixed setting 16 bar

Switching pressure of flushing spool Δp

- Size 60 to 115 (small flushing valve) 8 ± 1 bar
- Sizes 115 to 215 (medium and large flushing valve) 17.5 ± 1.5 bar

Flushing flow q_v

Orifices can be used to adjust the flushing flows as required. The following parameters are based on:

$\Delta p_{ND} = p_{ND} - p_G = 25$ bar and $v = 10$ mm²/s (p_{ND} = low pressure, p_G = case pressure)

Small flushing valve for sizes 60 to 115

The countersink can be deeper than as specified in the standard.

BVD and BVE counterbalance valves

Function

Counterbalance valves for travel drives and winches should reduce the danger of overspeed and cavitation in open circuits of axial piston motors. Cavitation occurs if, during braking, when going downhill or during the load-lowering process, the motor speed is greater than it should be for the given inlet flow and thus the supply pressure collapses. If the supply pressure falls below the value specified for the relevant counterbalance valve, the counterbalance spool moves into the closed position. The cross-sectional area of the counterbalance valve return duct is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor reaches the specified value for the given inlet flow.

Notice

- ▶ BVD available for sizes 60 to 215 and BVE available for sizes 115 to 215.
- ▶ The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set.
Order example: A6VE085HA1T30004A/71MWW0Y2Z 97W0-0 + BVD20F27S/41B-V03K16D0400S12

- ▶ For safety reasons, controls with beginning of control at $V_{g \min}$ (e.g. HA) are not permissible for winch drives!
- ▶ Counterbalance valves must be optimized during prototype commissioning to prevent unacceptable operating conditions and compliance with the specification must be verified.
- ▶ The counterbalance valve does not replace the mechanical service brake and holding brake.
- ▶ Observe the detailed notes on the BVD counterbalance valve in RE 95522 and BVE counterbalance valve in RE 95525.
- ▶ For the design of the brake release valve, we require the following data for the mechanical holding brake:
 - the cracking pressure
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

Mounting of the counterbalance valve

When delivered, the counterbalance valve is fastened to the motor with two tacking screws (transport lock). The tacking screws may not be removed while mounting the working lines! If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be fastened to the motor port plate using the provided tacking screws.

The counterbalance valve is finally mounted to the motor by fitting the SAE flange

The screws to be used and the instructions for mounting can be found in the instruction manual.

1) Pressure relief valve

2) Counterbalance valve, dual action

3) Counterbalance valve, single action

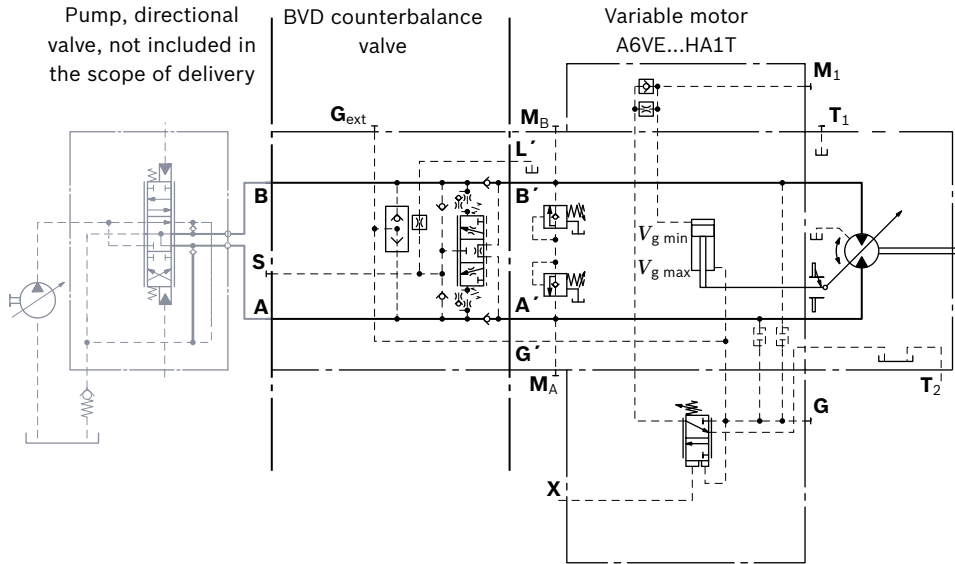

Counterbalance valve for travel drive BVD...F

Application option

- ▶ Travel drives for wheeled excavators (BVD and BVE)

▼ **Example circuit diagram for travel drive on wheeled excavators**

1) At the mounting version for the controls HP5, HP6 and EP5, EP6, the cast-in port designation **A** and **B** on the BVD/BVE counterbalance valve do not correspond with the connection designation of the A6VE motor.
The designation of the ports on the installation drawing of the motor is binding!

2) Depending on the application, momentary pressure peaks can occur. Keep this in mind when selecting measuring devices and fittings.
3) The countersink can be deeper than as specified in the standard.
4) O = Must be connected (plugged when delivered)
X = Plugged (in normal operation)

Integrated BVI counterbalance valve

Function

The integrated counterbalance valves for track drives in excavator crawlers should reduce the danger of overspeed and cavitation of axial piston motors in open circuits. Cavitation occurs if, during braking or driving downhill, the rotational speed of the motor is greater than it should be for the given inlet flow, causing the supply pressure to fall sharply.

If the supply pressure falls below the value specified for the relevant counterbalance valve, the counterbalance spool moves into the closed position. The cross-sectional area of the counterbalance valve return duct is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor reaches the specified value for the given inlet flow.

Notice

- ▶ BVI available for sizes 115 and 170.
- ▶ The counterbalance valve must be ordered additionally. Order example: A6VE115HA3T30004A/71MWV0Y2Z 96Y0-0 + BVI510008001-0
- ▶ Counterbalance valves must be optimized during prototype commissioning to prevent unacceptable operating conditions and compliance with the specification must be verified.
- ▶ The counterbalance valve does not replace the mechanical service brake and holding brake.
- ▶ For the design of the brake release valve, we require the following data for the mechanical holding brake:
 - the cracking pressure
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

1) Only dimensions according to SAE J518, metric fastening thread is a deviation from the standard
 2) Depending on the application, momentary pressure peaks can occur. Keep this in mind when selecting measuring devices and fittings.
 3) Depending on installation position, T₁ or T₂ must be connected (see also installation instructions on page 38).
 4) The countersink can be deeper than as specified in the standard.

5) O = Must be connected (plugged when delivered)
 X = Plugged (in normal operation)
 6) Must be connected for external piping. Is plugged for internal channel routing.
 7) Is plugged for external channel routing. Must be connected for internal piping.

Speed sensor

The A6VE...U version ("prepared for speed sensor", i.e. without sensor) is equipped with a spline on the rotary group.

A signal proportional to the rotational speed of the motor can be generated with the mounted DSA speed sensor.

The DSA sensor registers the rotational speed and direction of rotation.

Type code, technical data, dimensions and parameters for the connector, plus safety instructions about the sensor can be found in the relevant data sheet 95133 – DSA. The sensor is mounted on the port provided specially for this with a mounting bolt. On deliveries without sensor, the port is plugged with a pressure-resistant cover.

We recommend ordering the A6VE variable motor complete with mounted sensor.

Installation instructions

General

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit may empty via the hydraulic lines.

The leakage in the housing area must be directed to the reservoir via the highest drain port (**T₁**, **T₂**).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the maximum permissible case pressure of all connected units is not exceeded at any operational conditions. If this is not possible, separate drain lines must be laid.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Notice

In certain installation positions, an influence on the control or closed loop control can be expected. Gravity, dead weight and case pressure can cause minor characteristic shifts and changes in response time.

Key

F	Filling / air bleeding
T₁, T₂	Drain port
$h_{t\ min}$	Minimum required immersion depth (200 mm)
h_{min}	Minimum required distance to reservoir bottom (100 mm)

Installation position

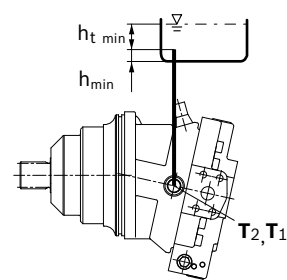

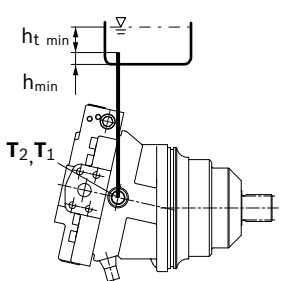

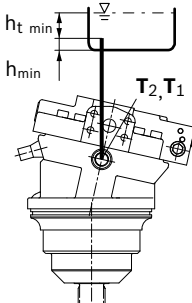

See the following examples **1** to **6**.

Further installation positions are available upon request.

Recommended installation position: **1** and **2**

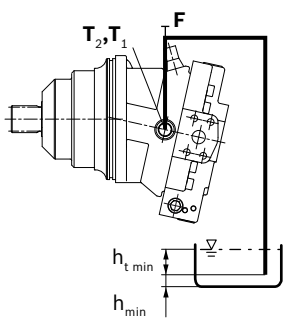

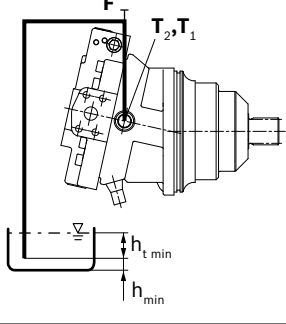

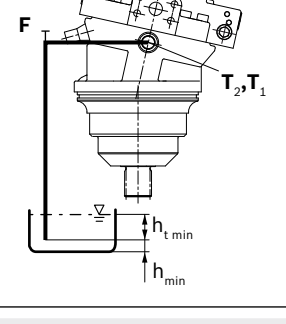

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir and below the minimum fluid level of the reservoir.

Installation position	Air bleed	Filling
1 		T₂, T₁
2 		T₂, T₁
3 		T₂, T₁

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Installation position	Air bleed	Filling
<p>4</p> 	F	T₂, T₁ (F)
<p>5</p> 	F	T₂, T₁ (F)
<p>6</p> 	F	T₂, T₁ (F)

Notice

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

Project planning notes

- ▶ The motor A6VE is designed to be used in open and closed circuits.
 - ▶ The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified skilled personnel.
 - ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
 - ▶ Before finalizing your design, please request a binding installation drawing.
 - ▶ The specified data and notes contained herein must be observed.
 - ▶ For safety reasons, controls with beginning of control at $V_{g \text{ min}}$ (e.g. HA) are not permissible for winch drives, e.g. anchor winches.
 - ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
 - ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or the instruction manual.
 - ▶ Not all versions of the product are approved for use in a safety function according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
 - ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. When a direct current is applied, solenoids do not cause electromagnetic interference nor is their operation impaired by electromagnetic interference. Other behavior can result when a modulated direct current (e.g. PWM signal) is applied. Potential electromagnetic interference for persons (e.g. persons with a pacemaker) and other components must be tested by the machine manufacturer.
 - ▶ Please note the details regarding the tightening torques of port threads and other threaded joints in the instruction manual.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports are only intended to accommodate hydraulic lines.

Safety instructions

- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve pistons) can, under certain circumstances get stuck in position as a result of contamination (e.g. impure hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filter) will not rule out a fault but merely reduce the risk.
The machine/system manufacturer must test whether remedial measures are needed on the machine for the application concerned in order to set the consumer being driven to a safe position (e.g. safe stop) and if necessary to ensure it is properly implemented.
- ▶ Moving parts in high-pressure relief valves may in certain circumstances become stuck in an undefined position due to contamination (e.g. contaminated hydraulic fluid). This can result in restriction or loss of the load holding function in lifting winches.
The machine/system manufacturer must check whether additional measures are required on the machine for the relevant application in order to keep the load in a safe position and ensure they are properly implemented.
- ▶ When using the axial piston motor in winch drives, make certain that the technical limit values are not exceeded under all operating conditions. If the axial piston motor is extremely overloaded (e.g. if the maximum permissible rotational speeds are exceeded during weighing of the anchor while the ship is in motion), the rotary group may be damaged and, in the worst case, the axial piston motor may burst. The machine manufacturer / system manufacturer is to undertake additional measures, up to and including encapsulation.

Axial piston variable motor A10VM

Plug-in version A10VE

Data sheet

Series 52
Size 28 to 85
Nominal pressure 280 bar
Maximum pressure 350 bar

Connector for solenoids	25
Speed pickup	26
Mounting position	27
General instructions	28

Features

- Dual displacement motor, axial piston swashplate design, for hydrostatic transmissions in open and closed circuits
- Output speed is directly proportional to inlet flow and inversely proportional to motor displacement
- Output torque increases proportional to the pressure difference between high and low pressure sides and increasing displacement
- Heavy duty bearings for long service life
- High permissible output speed
- Well proven A10-rotary unit technology
- High power/weight ratio – compact dimensions
- Cost effective
- Low noise
- External control pressure supply possible
- Minimum displacement can be set externally
- SAE-2-bolt mounting flange on A10VM
- Special 2-bolt mounting flange on A10VE

Technical data

Fluid

Prior to project design please see our data sheets RE 90220 (mineral oil), RE 90221 (ecologically acceptable fluids) and RE90223 (HF-fluids) for detailed information on fluids and application conditions.

When operating on ecologically acceptable fluids, limitations to the technical data may be necessary.

Please contact us and state the fluid used in clear text when ordering.

Operating viscosity range

For optimum efficiency and service life we recommend an operating viscosity (at operating temperature) in the range

$$v_{opt} = \text{opt. operating viscosity } 16 \dots 36 \text{ mm}^2/\text{s}$$

referred to circuit temperature in closed circuits or tank temperature in open circuits.

The following limits are valid for extreme operating conditions:

$$v_{min} = \begin{matrix} 5 \text{ mm}^2/\text{s} & \text{(closed circuit)} \\ 10 \text{ mm}^2/\text{s} & \text{(open circuit)} \end{matrix}$$

briefly ($t \leq 1 \text{ min}$) at max. permissible temperature of $115 \text{ }^\circ\text{C}$.

Please note, that the max. fluid temperature of $115 \text{ }^\circ\text{C}$ may also not be exceeded in certain areas (for instance bearing area) The temperature in the bearing area is approx. 5 K higher than the average fluid temperature.

$$v_{max} = 1600 \text{ mm}^2/\text{s} \text{ briefly } (t \leq 1 \text{ min})$$

on cold start ($t_{min} = -25 \text{ }^\circ\text{C}$, $p \leq 30 \text{ bar}$, $n \leq 1000 \text{ rpm}$).

At temperatures between $-25 \text{ }^\circ\text{C}$ and $-40 \text{ }^\circ\text{C}$ special measures may be required for certain installation positions. Please consult us for further information

For detailed information on operation at very low temperatures see RE 90300-03-B.

Notes on the selection of the hydraulic fluid

In order to select the correct fluid, it is necessary to know the operating temperature in the tank (open circuit), circuit temperature (closed circuits), in relation to the ambient temperature.

The fluid should be selected, so that within the operating temperature range, the viscosity lies within the optimum range (v_{opt}), see shaded section of the selection diagram. We recommend to select the higher viscosity grade in each case.

Example: at an ambient temperature of $X \text{ }^\circ\text{C}$ the operating temperature in the tank is $60 \text{ }^\circ\text{C}$. In the optimum viscosity range (v_{opt} ; shaded area) this corresponds to viscosity grades VG 46 resp. VG 68; select VG 68.

Important: The leakage fluid (case drain fluid) temperature is influenced by pressure and motor speed and is always higher than the tank temperature. However, at no point in the circuit may the temperature exceed $115 \text{ }^\circ\text{C}$.

If it is not possible to comply with the above conditions because of extreme operating parameters or high ambient temperatures please consult us

Filtration of fluid

The finer the filtration the better the achieved cleanliness of the fluid and the longer the life of the axial piston unit.

To ensure a reliable functioning of the axial piston unit, a minimum cleanliness of

20/18/15 to ISO 4406 is necessary.

At very high fluid temperatures ($90 \text{ }^\circ\text{C}$ to max. $115 \text{ }^\circ\text{C}$) the minimum cleanliness has to be at least

19/17/14 to ISO 4406.

If above cleanliness classes cannot be met please consult us.

Operating pressure range

Pressure at port A or B

(Pressure data to DIN 24312)

 In closed circuit Δp 260bar at $p_{\text{boostpress.}} 20\text{bar}$

Minimum required outlet pressure (low pressure) at port A (B) depending on motor speed

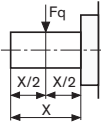

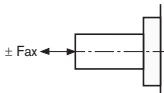

Technical data

Calculating size

Flow	$q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v}$	[L/min]	$V_g =$ Displacement per rev. in cm^3
Torque	$T = \frac{1,59 \cdot V_g \cdot \Delta p \cdot \eta_{mh}}{100}$	[Nm]	$\Delta p =$ Differential pressure in bar
or	$T = T_K \cdot \Delta p \cdot \eta_{mh}$		$n =$ speed in rpm
Output power	$P = \frac{2\pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600}$	[kW]	$\eta_v =$ Volumetric efficiency
Output speed	$n = \frac{q_v \cdot 1000 \cdot \eta_v}{V_g}$	$[\text{min}^{-1}]$	$\eta_{mh} =$ Mechanical-hydraulic efficiency
			$\eta_t =$ Total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)
			$T_K =$ Torque constant

Permissible radial and axial forces on drive shaft

Size		28	45	63	85
Max. radial force	 at X/2 $F_{q \max}$ N	1200	1500	1700	2000
Max. axial force	 $\pm F_{ax}$ F_{ax} N	1000	1500	2000	3000

Two-point direct control DG

Normally the motor is at max. displacement. By applying an external pressure to port G, the control piston is directly pressurized and the motor swivels back to min. displacement

The minimum required control pressure is $p_{St} \geq 40$ bar

Please note, that this minimum required control pressure at port G depends directly on the operating pressure p_B in port A or B. (Pressure in A or B), see control pressure diagram below. With a control pressure above this minimum required pressure level the motor will destroke properly.

Control pressure diagram

Control pressure = 0 bar $\triangleq V_{g \max}$

Control pressure ≥ 40 bar $\triangleq V_{g \min}$ (see circuit diagram)

The max. permissible control pressure is $p_{St} = 280$ bar.

$V_{g \min}$ adjustment please state in clear text with order

Circuit diagram

Ports for

A, B	Pressure
L, L ₁	Cause drain (L ₁ plugged)
G, G ₁	For external control pressure (G ₁ plugged)

Two-point control, hydraulically operated HZ/HZ6

Normally the motor is at max. displacement. By applying a pilot pressure p_x to port X the pilot valve shifts and the control piston is pressurized causing the motor to swivel to min. displacement ($p_x \geq 30\text{bar}$).

The necessary control pressure is via a shuttle valve taken out of the motor pressure side A or B. A minimum pressure difference of $\Delta p_{A,B} \geq 20\text{ bar}$ between the motor pressure sides is required.

Only $V_{g\text{ max}}$ or $V_{g\text{ min}}$ are possible.

$V_{g\text{ min}}$ - adjustment please state in clear text when ordering.

Pilot pressure $p_x = 0\text{ bar} \triangleq V_{g\text{ max}}$

Pilot pressure $p_x \geq 30\text{ bar} \triangleq V_{g\text{ min}}$

Techn. data HZ/HZ6	
Minimum pilot pressure	30 bar
Maximum permissible pilot pressure	280 bar

Version HZ6 with stroking time shuttle orifice

Slow down of swivel action by means of shuttle orifice.

This enables a smooth swivel action.

Standard orifice size = 0.21 mm; other sizes on request.

Circuit diagram HZ

Ports for

A, B	Pressure
L, L ₁	Case drain (L ₁ plugged)
X	Pilot pressure (plugged)

Two-point control, electrically operated EZ¹⁾

Normally the motor is at maximum displacement. By energizing the solenoid of the control valve, the control piston is pressurized and the motor swivels to minimum displacement.

The control pressure is via a shuttle valve taken out of the motor pressure side A or B. A minimum pressure difference of $\Delta p_{A,B} \geq 20$ bar between the pressure sides is required.

The motor can only swivel between $V_{g \max}$ or $V_{g \min}$.

$V_{g \min}$ - adjustment please state in clear text when ordering.

De-energized $\triangleq V_{g \max}$

Energized $\triangleq V_{g \min}$

Techn. data EZ

Drive shaft

Integrated flushing and boost press. relief valve, N007

The flushing and boost pressure relief valve is used in closed circuits to flush an unacceptable heat load out of the circuit and to maintain a minimum boost pressure level (fixed setting). The valve is integrated into the port plate.

A built-in fixed orifice determines the flushing flow, which is taken out of the low pressure side of the loop and directed into the motor housing. It leaves the housing together with the case drain flow. This combined flow must be replenished with fresh, cool fluid by means of the boost pump.

Standard flushing flow

With a pressure of $p_{ND} = 20$ bar in the low pressure side of the circuit and an orifice dia. of $\varnothing 1.6$ mm the flushing flow amounts to 5.5 L/min (Size 28 - 85).

Other orifice diameters can be ordered in clear text.

Further flushing flows for sizes 28 - 85 see table:

Flushing flow (L/min)	Orifice dia. in mm
3.5	1.2
5.5	1.6
7.2	1.8

HIRSCHMANN DIN EN 175 301-803-A /ISO 4400

(not for new projects)

without bidirectional suppressor diode _____ H

Degree of protection to DIN/EN 60529: IP65

The sealing ring in the cable gland (M16x1,5) is suitable for cables 4.5 mm to 10 mm in diameter.

The HIRSCHMANN-connector is part of the scope of supply of the motor.

Note for round solenoids:

The position of the connector can be changed by turning the solenoid body.

Proceed as follows:

- 1. Loosen fixing nut (1)
- 2. Turn the solenoid body (2) to the desired position.
- 3. Tighten the fixing nut

Tightening torque of fixing nut: 5+1 Nm

Speed pickup

Before finalising your design please request a certified installation drawing.
Dimensions in mm

The version A10VM/E...D („prepared for speed pickup“) comprises gearing around the rotary unit.

Circuit diagram

In this case, the rotating cylinder barrel can provide a speed dependent signal, which can be picked up by a suitable sensor and processed for further evaluation. The sensor port will be plugged for delivery.

This preparation for speed pickup does not include the necessary working parts. They must be ordered separately as a kit with a corresponding part number.

Inductive speed sensor ID R 18/20-L250 (see RE 95130) and mounting parts (spacer and 2 seals per kit) can be ordered separately under the following part numbers:

Size	Part Nr.	Number of teeth
28	R902428802	48
45	R902437557	48
63	R902428802	56
85	in preparation

85	130	91.3	45°

A10VE 45

Mounting position

The motor housing must be filled during start up and operation. The drain line must be arranged, so that the housing cannot empty itself when the motor is at standstill. The end of the drain line must enter the tank below the minimum fluid level.

In all installation positions the highest case drain port must be used to fill the housing and to connect the drain line.

In case of a vertical installation please consult us.

A10VM

A10VE

General instructions

- The A10VM/VE is designed for operation in open and closed circuits
- Systems design, installation and commissioning requires trained technicians or tradesmen.
- Be sure to read the entire operating instructions thoroughly and completely before using the axial piston unit. If necessary, request them at Rexroth.
- All hydraulic ports can only be used for the fastening of hydraulic service lines.
- During and shortly after operation of an axial piston unit the housing and especially a solenoid can be extremely hot, avoid being burned; take suitable safety measures (wear protective clothing).
- Dependent on the operating conditions of the axial piston unit (operating pressure, fluid temperature) deviations in the performance curves can occur.
- Pressure ports:
All materials and port threads are selected and designed in such a manner, that they can withstand the maximum pressure. The machine and system manufacturer must ensure, that all connecting elements and hydraulic lines are suitable for the actual operating pressures.
- Pressure cut off and pressure control are not suitable for providing system protection against excessive pressures. A suitable overall main line relief valve must be incorporated.
- All given data and information must be adhered to.
- The following tightening torques are valid:
 - Female threads in the axial piston unit:
the maximum permissible tightening torques $M_{G_{max}}$ are maximum values for the female threads in the pump casting and may not be exceeded. Value see table below.
 - Fittings:
please comply with the manufacturer's information regarding the max. permissible tightening torques for the used fittings.
 - Fastening bolts:
for fastening bolts to ISO 68 we recommend to check the permissible tightening torques in each individual case to VDI 2230.
 - Plugs:
for the metal plugs, supplied with the axial piston unit the following min. required tightening torques M_V apply (see table).

Threaded port sizes		Maximum permissible tightening torque of the threaded holes $M_{G_{max}}$	Required tightening torque of the locking screws M_V	WAF hexagon socket of the locking screws
7/8-14 UNF-2B	ISO 11926	240 Nm	127 Nm	3/8 in
7/16-20UNF-2B	ISO 11926	40 Nm	15 Nm	3/16 in

Reversible axial piston variable motor A10VER series 52 for hydrostatic fan drives

- ▶ Sizes 30 to 45
- ▶ Nominal pressure 280 bar
- ▶ Maximum pressure 350 bar
- ▶ Open circuit

Features

- ▶ Variable motor with axial piston rotary group in swash-plate design for hydrostatic fan drives in open circuits
- ▶ The output speed is proportional to the inlet flow
- ▶ The output torque increases proportionally with the pressure difference between the high- and low-pressure sides and increasing displacement
- ▶ Specially developed for hydrostatic fan drives
- ▶ The A10VER variable motor is equipped with a rotary group of the overcenter type with a maximum displacement of $\pm 100\% V_{g \max}$. This permits reversing operation without the need for costly additional components for air flow reversal and the cleaning of contaminated coolers, and thus achieves fuel savings by means of improved cooling performance.
- ▶ The energy efficiency of hydraulic fan drives is increased due to the elimination of external reversing valves.
- ▶ Stable storage for long service life
- ▶ High permissible output speed
- ▶ Favorable power-to-weight ratio – compact dimensions
- ▶ Low noise

Note

Observe the project planning notes on page 16 or the project planning and commissioning instructions 90363.

- 1) Additional sizes available on request
- 2) Additional directions of rotation available on request
- 3) Specify ordering code of sensor in accordance with data sheet 95132 – DSM or 95133 – DSA separately and observe the requirements for the electronics.

Hydraulic fluids

The A10VER variable motor is designed for operation with HLP mineral oil according to DIN 51524. For more hydraulic fluids please contact us.

Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids

Details regarding the selection of hydraulic fluid

The hydraulic fluid should be selected so that the operating viscosity in the operating temperature range is within the optimum range (v_{opt} , see selection diagram).

Note

At no point on the component may the temperature be higher than 115 °C. The temperature difference specified in the table is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, please contact the responsible member of staff at Bosch Rexroth.

Viscosity and temperature of hydraulic fluids

	Viscosity	Temperature ¹⁾	Comment
Cold start	$v_{max} \leq 1600 \text{ mm}^2/\text{s}$	$\theta_{St} \geq -25 \text{ °C}$	$t \leq 1 \text{ min}$, without load ($p \leq 30 \text{ bar}$), $n \leq 1,000 \text{ rpm}$
	permissible temperature difference	$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid
Warm-up phase	$v < 1600 \text{ to } 400 \text{ mm}^2/\text{s}$	$\theta = -25 \text{ °C to } -10 \text{ °C}^{1)}$	Observe the detailed information on operation at low temperatures, see data sheet 90300-03-B
Continuous operation	$v = 400 \text{ to } 10 \text{ mm}^2/\text{s}$	$\theta = -25 \text{ °C to } +110 \text{ °C}$	This corresponds, for example on the VG 46, to a temperature range of +5 °C to +85 °C (see selection diagram page 3)
	$v_{opt} = 36 \text{ to } 16 \text{ mm}^2/\text{s}$		measured at port L Observe the permissible temperature range of the shaft seal ($\Delta T = \text{approx. } 5 \text{ K}$ between the bearing/shaft seal and port L)
Short-term operation	$v_{min} \geq 7 \text{ mm}^2/\text{s}$		$t < 1 \text{ min}$, $p < 0.3 \cdot p_{nom}$

▼ Selection diagram

1) At temperatures from -40° C to -25° C please contact us

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), at least cleanliness level 19/17/14 according to ISO 4406 is necessary.

Please contact us if the above classes cannot be observed.

Operating pressure range

Pressure at service line port B		Definition
Nominal pressure p_{nom}	280 bar absolute	The nominal pressure corresponds to the maximum design pressure. The series control of motors is not permissible.
Maximum pressure p_{max}	350 bar absolute	The maximum pressure corresponds the maximum working pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.
Single operating period	2.5 ms	
Total operating period	300 h	
Minimum pressure $p_{MD abs}$ (high-pressure side)	20 bar absolute	Minimum pressure on the high-pressure side (B) which is required in order to prevent damage to the axial piston unit.
Rate of pressure change $R_{A max}$	16000 bar/s	Maximum permissible rate of pressure build-up and reduction during a pressure change over the entire pressure range.
Pressure at low-pressure port A		
Minimum pressure $p_{ND min}$	Standard 2 bar absolute	Minimum pressure at low-pressure port A (outlet) that is required in order to avoid damage to the axial piston unit.
Maximum pressure $p_{ND max}$	10 bar absolute ¹⁾

Determining the operating characteristics		
Inlet flow	$q_v = \frac{V_g \times n}{1000 \times \eta_v}$	[l/min]
Torque	$T = \frac{1.59 \times V_g \times \Delta p \times \eta_{\text{hm}}}{100}$	[Nm]
or	$T = T_K \times \Delta p \times \eta_{\text{hm}}$	
Power	$P = \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p \times \eta_t}{600}$	[kW]
Output speed	$n = \frac{q_v \times 1000 \times \eta_v}{V_g}$	[rpm]

Key	
V_g	= Displacement per revolution [cm ³]
Δp	= Differential pressure [bar]
n	= Rotational speed [rpm]
η_v	= Volumetric efficiency
η_{hm}	= Hydraulic mechanical efficiency
η_t	= Total efficiency ($\eta_t = \eta_v \times \eta_{\text{hm}}$)
T_K	= Torque constant

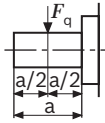

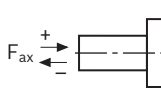

Note

- ▶ Theoretical values, without efficiency and tolerances; values rounded
- ▶ Exceeding the maximum or falling below the minimum permissible values can lead to a loss of function, a reduction in operational service life or total destruction of the axial piston unit. Bosch Rexroth recommends testing the load by means of experiment or calculation / simulation and comparison with the permissible values.

1) The values apply:
 - At absolute pressure $p_{\text{abs}} = 2$ bar at low-pressure port **A**
 - For the optimal viscosity range of $\nu_{\text{opt}} = 36$ to 16 mm²/s
 - For hydraulic fluid based on mineral oils

2) The data are valid for values between the minimum necessary and the maximum permissible drive speeds. Valid for external excitation (e. g. diesel engine 2 to 8 times rotary frequency, cardan shaft twice the rotary frequency). The limit value is only valid for a single pump. The load capacity of the connecting parts must be considered.

Permissible radial and axial forces of the drive shafts

Size		NG	30	37	45	
Maximum radial force at a/2		$F_{q \max}$	N	1500	1500	1500
Maximum axial force		$\pm F_{ax \max}$	N	1500	1500	1500

Note

- The values given are maximum values and do not apply to continuous operation. For drives with radial loading (pinion, V-belt drives), please contact us!

EZ. – Two-point control, electric

The variable motor is set to $V_{g \max} +100\%$ or $V_{g \max} -100\%$ by actuating the solenoid of the control valve. When de-energized, the axial piston units swivels to $V_{g \max} +100\%$, when energized, to $V_{g \max} -100\%$. The response time is extended via the in-built orifice, thus enabling smooth swiveling.

With each direction of rotation of the motor, the control pressure is taken at the high-pressure side **B**.

▼ Characteristic curve EZ

Influencing the swivel position

Swivel direction + 100%	Swivel cradle position
De-energized \triangle	$V_{g \max} +$
Swivel direction - 100%	
Energized \triangle	$V_{g \max} -$

Note

Observe the project planning notes on page 16 or the project planning and commissioning instructions 90363.

1) Thread according to ASME B1.1
 2) Thread according to DIN 13
 3) For the maximum tightening torques, see instruction manual.
 4) Depending on the application, temporary pressure peaks can occur.
 Keep this in mind when selecting measuring devices and fittings.

5) Metric fastening thread is a deviation from standard
 6) The spot face can be deeper than as specified in the standard.
 7) O = Must be connected (plugged on delivery)
 X = Plugged (in normal operation)

Anti cavitation valve

Without pressure cut-off

Order option ...N002

When switching off the system, the anti cavitation valve ensures the motor of heavy-duty drives (e.g. hydrostatic fan drives) is supplied with hydraulic fluid until it comes to a standstill.

The valve is integrated in the port plate.

Note

- ▶ Observe the direction of rotation of the unit during project planning.
- ▶ The standard rotation of direction is clockwise. Please contact us regarding counter-clockwise rotation.

The external unit dimensions correspond to the standard version, see the unit dimensions for the length dimensions.

▼ Circuit diagram

Clockwise rotation

Speed pickup

Order option ...B or M

A signal proportional to the motor speed can be generated with the fitted DSA (B)/DSM (M) speed sensor. The DSA/DSM sensor measures the speed and/or direction of rotation.

Ordering code, technical data, dimensions, and details on the connector, plus safety information about the sensor can be found in the relevant data sheet 95132 – DSM and 95133 – DSA.

The sensor is mounted on the port provided for this purpose with a mounting bolt.

Connector for solenoids

DEUTSCH DT04-2P-EP04

Molded connector, 2-pin, without bidirectional suppressor diode

The following type of protection ensues with a mounted mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

▼ Switching symbol

▼ Mating connector DEUTSCH DT06-2S-EP04

Consisting of	DT designation
1 housing	DT06-2S-EP04
1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery. This can be supplied by Bosch Rexroth on request (material number R902601804).

Note

If necessary, you can change the connector orientation by turning the solenoid housing.

The procedure is defined in the instruction manual.

System solution for hydrostatic fan drives with reversing function

AFC30 software

The BODAS AFC30 is a standard software solution integrated in the RC4-5/30 control unit from Rexroth for controlling hydrostatic fan drives with fixed or variable hydraulic pumps. The AFC30 is designed to control a fan drive in an open hydraulic circuit. The performance requirement of the fan can be modified for up to 6 temperature signals (analog//J1939). The AFC30 can be used with 12 V and 24 V systems. Since the AFC30 provides cooling capacity according to requirements, fuel consumption is significantly reduced compared with fan drive systems that are not proportionally controlled.

Further information on this can be found in data sheets

- ▶ 95362 (application software fan speed control AFC30) and
- ▶ 95205 (BODAS controller RC4-5, series 30)

Installation instructions

General

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit may empty via the hydraulic lines.

The drain in the housing area must be discharged to the reservoir via the highest available tank port (L). If this is not possible, separate drain lines must be installed if necessary. To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

Note

In certain installation positions, an influence on the control characteristic can be expected. Gravity, dead weight and case pressure can cause minor shifts in characteristics and changes in response time.

For key, see page 15.

Installation Position

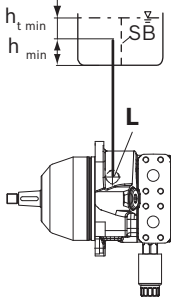

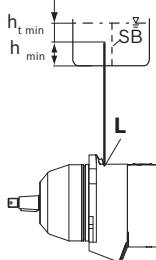

See the following examples **1** to **4**.

Additional installation positions are available upon request.

Recommended installation position: **2**

Below-reservoir installation (standard)

Below-reservoir installation is when the axial piston unit is installed outside of the reservoir below the minimum fluid level.

Installation Position	Air bleeding	Filling
1 	-	L
2 	-	L

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Installation position	Air bleeding	Filling
3	-	L

4	F	L
----------	----------	----------

Key	
F	Filling / air bleeding
L	Tank port
SB	Baffle (baffle plate)
$h_{t\ min}$	Minimum required immersion depth (200 mm)
$h_{\ min}$	Minimum required distance to reservoir bottom (100 mm)

Note
Port **F** is part of the external piping and must be provided by the customer to make filling and air bleeding easier.

Project planning notes

- ▶ The A10VER variable motor is designed for fan drives used in open circuits.
- ▶ The project planning, installation and commissioning of the axial piston unit require the involvement of qualified skilled personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, request it from Bosch Rexroth.
- ▶ Before finalizing your design, request a binding installation drawing.
- ▶ The specified data and notes must be observed.
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of these conditions can be found in the data sheet 90312 or the instruction manual.
- ▶ Not all variants of the product are approved for use in safety functions according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. When a direct current is applied, solenoids do not cause electromagnetic interference nor is their operation impaired by electromagnetic interference. Other behavior can result when a modulated direct current (e.g. PWM signal) is applied. Potential electromagnetic interference for persons (e.g. persons with a pacemaker) and other components must be tested by the machine manufacturer.

- ▶ Pressure controllers are not safeguards against pressure overload. A pressure relief valve is to be provided in the hydraulic system.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the intended operating conditions (pressure, flow, hydraulic fluid, temperature) and the necessary safety factors.
 - The working ports and function ports can only be used to accommodate hydraulic lines.
- ▶ Further specific information on this product can be found in the project planning note 90363.

Safety instructions

- ▶ During and shortly after operation, there is a risk of burning on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control and regulation systems (e.g. valve spools) may in certain circumstances become stuck in an undefined position due to contamination (e.g. contaminated hydraulic fluid, abrasion or residual dirt from components). As a result, the hydraulic fluid flow or torque build-up of the axial piston unit will no longer respond correctly to the operator's commands. Even the use of different filter cartridges (external or internal inlet filter) will not rule out a fault but merely reduce the risk. The machine/system manufacturer must check whether additional measures on the machine are required for the relevant application in order to bring the powered load into a safe position (e.g. safe stop) and ensure all appropriate measures are taken.

Features

- Space-saving installation due to compact design and direct mounting on A2FM(E) and A6VM axial piston motors (series 63)
- Available as a complete set with A2FM(E) and A6VM axial piston motors (series 63) and GFT gear units; test stand run as standard.
- Standard service line ports according to SAE J518
- Integrated brake release valve, with and without pressure reduction
- High efficiency due to low flow resistance
- Easy optimization options during commissioning due to modular design.

Ordering information

When placing the order, the following information is necessary to ensure correct settings at our test stands:

- **Motor ordering code**
- **Counterbalance valve ordering code**
- **Flow**
- **Application (e.g. excavator, winch etc.)**
- **Pressure setting of the secondary pressure relief valves in the motor**

Gear unit and/or counterbalance valve and axial piston motor can be ordered as ready-assembled and tested units.

Type selection (Ordering Code)

Size

depends on the necessary flow rate and the available motor port plates.

Control range

defines the pressure range at which the brake piston starts to open.

For travel drives in wheeled vehicles, use code "F":

The control piston opens at a differential pressure between A and B of 7 bar. In this case, the brake is not operated via the port for brake release on the counterbalance valve.

For winch and track drives, use code "W"

The control piston opens at a differential pressure between A and B of 20 bar. This ensures that the mechanical park brake actuated via the brake release port is fully opened (generally at 18 bar) before the brake piston opens.

Ports

depend on the motor size used.

The line ports A and B on the motor port plates are of different distance and diameter. To choose the appropriate connection, please refer to the table in the ordering code and on page 10.

For A2FM/E, sizes 28, 32 and 45, a intermediate plate is required between motor port plate 181 and the counterbalance valve. This intermediate plate is automatically included when motor and counterbalance valve are ordered as a set.

Brake release

The integrated pressure reduction valve is necessary when the mechanical brake on the gear unit cannot handle the full system pressure.

The maximum permitted brake release pressure must be agreed with the winch manufacturer. The brake release valve limits the high pressure to 21...25 bar (4 bar tolerance). It opens at about 10-14 bar.

Piston version ...

depends on the maximum flow across the counterbalance valve.

If for instance the maximum operational flow is only some 110 l/min while using a size 20 counterbalance valve which features a nominal flow of 220 l/min, then select the 50% control piston (code „03“). This ensures smooth operation.

If the desired flow is not within the range of the pistons supplied, please contact us.

Residual opening in piston ...

ensures soft stopping of wheeled vehicles. In winch applications, any residual opening is prohibited, since otherwise the load would not stay suspended. Therefore select code "K00".

Damping

defines the closing speed of the counterbalance valve. The higher the value, the faster the valve closes.

For the initial layout (prototype), we recommend the following damping:

- for wheel drives: D0400
- for winches and track drives: D0800

Flushing cavity

supplies motor flushing oil via an internal port. Only available for A6VM.

Design and Safety Instructions

Failure to observe any of the following points can lead to uncontrolled working conditions with serious personal injury and material damage:

- The counterbalance valve does **not** replace the mechanical park brake. Provide appropriate mechanical brake systems.
- Counterbalance valves are only used in open circuit.
- System optimization for the first prototype is recommended with regard to the valve block, axial piston motor, counterbalance valve and park brake.
- The counterbalance valve and main control valve must be matched to one another.
- If a park brake is installed, it must not close until after the counterbalance valve has closed. Otherwise excessive wear will be caused to the brake linings.
- Comply with the maximum control pressure of the park brake. If necessary, use the integrated pressure reduction valve as a brake release valve with reduced high pressure (code "L")
- The counterbalance valve converts the entire kinetic energy/potential energy into heat during the braking/lowering process. Consequently, ensure sufficient cooler and/or tank capacity.

- Counterbalance valves should be operated in combination with close-by secondary pressure relief valves, in order to protect the motor against pressure spikes. The motor port plates for direct installation of the counterbalance valve (A2FM: plate 181; A2FE: plate 171/181; A6VM: plate 370/380) already contain these secondary pressure relief valves.
- Auxiliary boost pressure at port S of the counterbalance valve reliably reduces the risk of cavitation due to lack of fluid in the low-pressure line. Ensure sufficient boost pressure and flow.
- The axial piston motor and counterbalance valve should always be ordered as a complete set. This ensures optimal matching and combined testing.
- If motor and counterbalance valve are ordered separately, consult our application engineers for the appropriate motor version.

The above safety measures and instructions must be adapted to the application and extended if necessary.

- Brake piston fully open
- Piston code 01 (100% $q_{v \text{ max}}$)

Operation

Travel/winch counterbalance valves are designed to reduce the danger of overspeeding and cavitation of axial piston motors in open controls. Cavitation occurs if the motor speed is greater than it should be for the given flow during braking, downhill travel or decrease in motor load.

Fixing the Counterbalance Valve

When delivered, the counterbalance valve is attached to the motor using 2 tacking screws. Do not remove the tacking screws when connecting the service lines. If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be attached to the motor port plate using the provided tacking screws. In both cases, the final attachment of the counterbalance valve to the motor is by the connection of the service lines, e.g. using SAE 4-bolt flanges. A total of 6 screws with thread lengths $B1+B2+B3$ and 2 screws with thread lengths $B3+B4$ are required.

When tightening the screws, it is imperative that the sequence 1 to 8 (as shown in the adjacent diagram) be adhered to and carried out in two phases.

In the first phase the screws should be tightened to 50% of their tightening torque before being tightened to maximum tightening torque in the second phase (see table below).

General Instructions

- The BVD counterbalance valve is designed to be used in open circuits.
- Project planning, assembly and commissioning of the axial piston unit with counterbalance valve require the involvement of qualified personnel.
- The service line ports and function ports are only designed to mounting hydraulic lines.
- During and shortly after operation, there is a risk of burns on the axial piston unit. Take suitable safety measures (e.g. wear protective clothing).
- There may be shifts in the characteristic depending on the operating state of the axial piston unit (operating pressure, fluid temperature).
- The data and note contained herein must be adhered to.
- The following tightening torques apply:
 - Threaded hole in axial piston unit:
The maximum permissible tightening torques M_{Gmax} are the maximum values for the threaded holes that must not be exceeded.
For values, refer to the following table.
 - Armatures:
Observe the manufacturer's instruction regarding tightening torques for the used armatures.
 - Fixing screws:
For fixing screws according to DIN 13, we recommend checking the tightening torque in individual cases as per VDI 2230.
 - Locking screws:
For the metallic locking screws supplied with the axial piston unit, the required tightening torques of locking screws M_V apply.
For values, refer to the following table.

Thread size at ports		Max. permissible tightening torque of the threaded holes M_{Gmax}	Required tightening torque of the locking screws M_V	WAF hexagon socket

Features

- Single-action counterbalance valve especially for winch drives in open circuits
- Sensitive damping for stable lowering
- Simple adaptation to application
- Compact design and direct fitting to axial piston motors A2FM, A2FE and A6VM, A6VE
- Available in a set with axial piston motors A2FM, A2FE and A6VM, A6VE.
- Standard service line ports according to SAE J518
- Integrated brake release valve optional, with or without pressure reduction
- Good efficiency through reduced flow losses

Project planning and safety instructions

Order details

When placing the order, the following information is necessary to ensure correct acceptance at our test stands:

- Motor ordering code
- Counterbalance valve ordering code
- Flow
- Application (e.g. winch)
- Pressure setting of the secondary pressure relief valves in the motor
- For the design of the brake release valve, we must know the following data for the mechanical park brake:
 - the cracking pressure
 - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
 - the required closing time for a warm device (oil viscosity approx. 15 mm²/s)

Counterbalance valve and axial piston motor can be ordered as a ready-assembled and tested unit.

Type selection (ordering code)

Control range

The control range defines the pressure range at which the counterbalance spool starts to open.

The control range of the counterbalance spool is to be chosen so that the mechanical park brake is fully open before the counterbalance spool starts to open.

Brake release

The integrated pressure reduction valve is necessary when the mechanical brake on the gear unit cannot handle the full system pressure.

The maximum permissible brake release pressure must be agreed with the winch manufacturer. The brake release valve reduces the high pressure to the value stated.

Counterbalance spool version

The counterbalance spool version depends on the maximum flow required through the counterbalance valve.

Counterbalance spool selection for required flow as per diagram on page 5.

If the desired flow is not within the range of the counterbalance spool supplied, please contact us.

Residual opening in counterbalance spool

In winch applications, any residual opening is prohibited, since otherwise the load would not stay suspended. For that reason, version "K00" is prescribed.

Damping

The throttle pin from D1 (inlet) and the orifice D2, plus the return pressure to the reservoir, define the actual cracking pressure of the counterbalance spool in M_{P1} .

The damping D1 (outlet) and D2 define the closing speed of the counterbalance spool. The larger the comparative diameter D1 (outlet), the faster the counterbalance spool will close (see table on page 4).

For the initial equipment (prototype), we recommend damping $D1 = D4599$ and $D2 = T30$.

Safety instructions

Failure to observe any of the following points can lead to uncontrolled operating conditions with serious personal injury and material damage.

- The counterbalance valve does **not** replace the mechanical park brake. If necessary, provide mechanical brake systems.
- Counterbalance valves are usually only used in open circuits.
- System optimization (reduction) for the first prototype is recommended with regard to the valve block, axial piston motor, counterbalance valve and park brake.
- The opening and closing characteristics of the counterbalance valve and control piston in the directional valve must be mutually compatible.
- The mechanical park brake in winch drives must only be effective after the counterbalance valve spool has closed. Otherwise, the brake will be subject to wear.
- Note the maximum permissible cracking pressure of the park brake. If necessary, use the integrated pressure reduction valve as a brake release valve with reduced high pressure (version "L").
- The counterbalance valve converts the entire kinetic energy/potential energy into heat during the braking/lowering process. Consequently, ensure sufficient cooler and/or tank capacity.
- Counterbalance valves should only be operated in combination with close-by secondary pressure relief valves in order to protect the motor against pressure spikes. The table on page 11 lists the motor and port plate types for the counterbalance valve BVE25. The port plates already contain the secondary pressure-relief valves.
- Feeding at port S of the counterbalance valve reduces the risk of cavitation. Ensure sufficient pressure and flow for feeding.
- We recommend ordering an axial piston motor and counterbalance valve as a single unit. This ensures optimal matching and combined testing.
- If motor and counterbalance valve are ordered separately, we recommend that you consult our application engineers for the appropriate motor version.

Further safety-relevant measures for the application must be added as necessary by the customer.

Technical data

Hydraulic fluid

The axial piston motor used is decisive for the choice of hydraulic fluid.
Further information should be taken from our data sheets during project planning.

Operating pressure range

Pressure at service line port C or D

Nominal pressure p_{nom} _____ 350 bar absolute
Maximum pressure p_{max} _____ 420 bar absolute
Single operating period _____ 10 s
Total operating period _____ 300 h

Definition

Nominal pressure p_{nom}

The nominal pressure corresponds to the maximum design pressure.

Maximum pressure p_{max}

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

Identification of cracking pressure p_1

(value without return pressure)

The throttle chain from D_1 and D_2 is used to damp the opening and closing speeds of the counterbalance spool. The actual working pressure, measured at M_{P1} , is reduced by the throttle chain from D_1 and D_2 and actuates the counterbalance spool. The dependence of the actual pressure value at M_{P1} for the opening of the counterbalance spool on the cross-sectional area of the orifice at D_1 and D_2 is stated in the table below.

Schematic

Table of values (theoretical values, without efficiency and tolerances; values rounded)

Size	NG			BVE.W	BVE.V
Operating pressure	p	bar	Nominal pressure	350	350
			Maximum pressure	420	420
Flow, nominal, at $\Delta p = 20$ bar	$q_{v\ max}$	L/min		320	320
Start of opening of counterbalance spool at port M_k	Δp_{KB}	bar		18	9
End of opening of counterbalance spool at port M_k	Δp_{KE}	bar		38	39
Pressure reduction valve for brake release (fixed values)	Maximum control pressure	p	bar	BVE...L/	21+4
					Start of control
Mass approx.	m	kg		18	18

Cracking pressure p_1

Pressure spring	Throttle pin in inlet channel D_1	Orifice in reservoir outlet D_2	Pressure value at counterbalance spool		Pressure value at port M_{P1}	
			Start of opening Δp_{KB} [bar] (approx.)	End of opening Δp_{KE} [bar] (approx.)	Start of opening Δp_1 [bar] (approx.)	End of opening Δp_1 [bar] (approx.)
W	0.45	0.3	18	38	24	51
V	0.45	0.3	9	39	12	52

Choosing the counterbalance spool version

Characteristic valid for BVE.../51.D). Schematic: see page 4

Pressure difference D → D'

(counterbalance spool at maximum opening)

Counterbalance spool closing time

(for choosing D1 outlet damping)

Pressure difference C' → C

Feed pressure at port S

The above specifications are based on:

- Oil viscosity $\nu = 10 \text{ mm}^2/\text{s}$
- Oil temperature $\vartheta = 50 \text{ }^\circ\text{C}$
- Counterbalance spool fully open

Note

Pressure Δp of approx. 20 to 50 bar is normal for regulating the maximum flow in winch systems. If the desired flow is not within the range of the two counterbalance spool supplied, please contact us.

Functional description

Winch counterbalance valves are designed to reduce the danger of overspeeding and cavitation of axial piston motors in open circuits. Cavitation occurs if during braking or the load-lowering process the motor speed is greater than it should be for the given inlet flow and therefore the inlet pressure collapses. If the inlet pressure drops below the given value Δp_{KE} (see table on page 4), the counterbalance spool will move towards the close position. The cross-sectional area of the counterbalance valve return channel is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor is again as it should be for the given inlet flow.

Brake release

Version S

Counterbalance valve with shuttle valve and port G_{ext} (plugged), without brake release valve (pressure reduction).

The respective high pressure is balanced via the shuttle valve and is available at port G_{ext} for release of the mechanical park brake. The brake release function without pressure reduction via the brake release valve is only employed if the mechanical park brake is approved for the maximum operating pressure.

Schematic

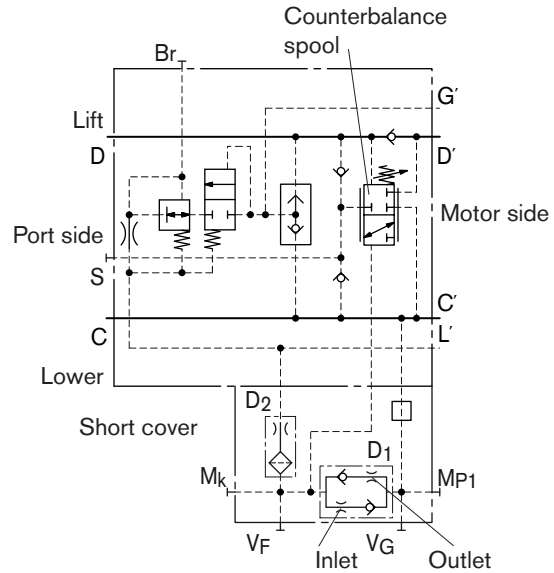

Version L

Counterbalance valve with shuttle valve, brake release valve for pressure reduction and port Br (plugged).

The respective high pressure is balanced and fed to the brake release valve (pressure reducing valve) via the shuttle valve. This opens from about 10 bar and reduces the respective operating pressure to approx. 21^{+4} bar. This brake release function is employed when the mechanical brake on the gear unit cannot handle the full system pressure.

The maximum permissible brake release pressure must be agreed with the winch manufacturer.

Mounting the counterbalance valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

When delivered, the counterbalance valve is mounted to the motor with two tacking screws (transport protection). The tacking screws may not be removed while mounting the service lines! If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be mounted to the motor port plate using the provided tacking screws. The counterbalance valve is finally mounted to the motor by screwing on the SAE flange with the following screws:

6 screws (1, 2, 3, 4, 5, 8) _____ length B1+B2+B3
 2 screws (6, 7) _____ length B3+B4

Tighten the screws in two steps in the specified sequence from 1 to 8 (see following scheme).

In the first step, the screws must be tightened with half the tightening torque, and in the second step with the maximum tightening torque (see following table).

Thread	Strength class	Tightening torque [Nm]

General instructions

- The BVE counterbalance valve is designed to be used in an open circuit.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- Before using the counterbalance valve, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the counterbalance valve and the axial piston unit. Take appropriate safety measures (e.g. by wearing protective clothing).
- Depending on the operating conditions of the counterbalance valve (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
 - The ports and fastening threads are designed for the specified maximum pressure of the counterbalance valve. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified operating conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to ISO 13849.
- The following tightening torques apply:
 - Fittings:
Observe the manufacturer's instructions regarding the tightening torques of the fittings used.
 - Mounting bolts:
For mounting bolts with metric ISO thread according to DIN 13, we recommend checking the tightening torque in individual cases in accordance with VDI 2230.
 - Female threads of the counterbalance valve or axial piston unit:
The maximum permissible tightening torques $M_{G \max}$ are maximum values of the female threads and must not be exceeded. For values, see the following table.
 - Threaded plugs:
For the metallic threaded plugs supplied with the counterbalance valve or axial piston unit, the required tightening torques of threaded plugs M_V apply. For values, see the following table.

Ports		Maximum permissible tightening torque of the female threads $M_{G \max}$	Required tightening torque of the threaded plugs M_V ¹⁾	WAF hexagon socket of the threaded plugs
Standard	Size of thread			
ISO 3852	M12 x 1.5	50 Nm	25 Nm ²⁾	6 mm
	M14 x 1.5	80 Nm	35 Nm	6 mm
	M27 x 2	330 Nm	135 Nm	12 mm

- 1) The tightening torques apply for screws in the “dry” state as received on delivery and in the “lightly oiled” state for installation.
 2) In the “lightly oiled” state, the M_V is reduced to 17 Nm for M12 x 1.5.

Counterbalance valve

BVD/BVE Series 52

- ▶ Size 32
- ▶ Nominal pressure Motor side 450 bar
 Pump side 350 bar
- ▶ For winches and track drives in open circuit

Features

- ▶ Damping for stable lowering and safe downhill movement
- ▶ Simple adaptation to application
- ▶ Compact design and direct mounting to axial piston motors A6VM and A6VE
- ▶ Available in a set with axial piston motors A6VM and A6VE
- ▶ Standard working ports according to SAE J518
- ▶ Integrated brake release port, with or without pressure reduction
- ▶ Good efficiency through reduced flow losses
- ▶ Four working ports (see type code, pos. 04)
- ▶ Rotationally symmetric
- ▶ Suitable for high flow rates

Technical data

Hydraulic fluid

The axial piston motor used is decisive for the selection of hydraulic fluid. For further information, please refer to our data sheets during project planning.

Note: At no point of the component may the temperature be higher than 115 °C.

Working pressure range

Pressure at working port C/D (on the pump side) or C'/D' (on the motor side)		Definition
Nominal pressure p_{nom}	On the pump side: 350 bar On the motor side: 450 bar	The nominal pressure corresponds to the maximum design pressure.
Maximum pressure p_{max}	On the pump side: 400 bar ¹⁾ On the motor side: 500 bar	Restrictions: ▶ maximum acceleration 7g ▶ maximum 1 million load changes

Determination of cracking pressure p_1 (values without return flow)

The throttle chain from **D**₁ and **D**₂ is used to damp the opening and closing speeds of the counterbalance spool. The actual pump pressure is reduced by the throttle chain from **D**₁ and **D**₂ and controls the counterbalance spool.

▼ Circuit diagram BVD

Table of values

Valve type				BVD...W	BVD...V	BVE...W
Nominal pressure	p	bar	On the pump side	350	350	350
			motor side	450	450	450
Flow, nominal	$q_{v max}$	l/min		650	650	650
Start of opening of counterbalance spool at port M _K	Δp_{KB}	bar		20	10	20
End of opening of counterbalance spool at port M _K	Δp_{KE}	bar		38	30	38
Pressure reducing valve for brake release (fixed setting)	Maximum control pressure	p	bar	BVE...L/	21 ⁺⁴	21 ⁺⁴
	Beginning of control	p	bar	BVE...L/	10 ⁺⁴	10 ⁺⁴
Weight approx.	m	kg		37	37	42

Notice

- ▶ Theoretical values, without efficiency and tolerances; values rounded
- ▶ Exceeding the maximum or falling below the minimum permissible values can lead to a loss of function, a reduction in operational service life or total destruction of the valve.

1) With versions "T03", "C03" and "D03" (concerns damping "D2", for reservoir outlet), pressures that are higher than the nominal pressure are **not** permitted

Characteristic curves for counterbalance spool 33

▼ Pressure differential at the outlet (via valve spool) $D' \rightarrow D$ or $C' \rightarrow C$ working port at rear (38)

▼ Pressure differential $D' \rightarrow D$ or $C' \rightarrow C$ (via valve spool) with working port offset by 90° (31)

▼ Pressure differential at the inlet (via check valve) $C \rightarrow C'$ or $D \rightarrow D'$ working port at rear (38)

▼ Pressure differential $C \rightarrow C'$ or $D \rightarrow D'$ (via check valve), with working port offset by 90° (31)

The above parameters are based on:

- ▶ Oil viscosity ν = approx. 21 mm²/s
- ▶ Oil temperature ϑ = 50 °C
- ▶ Counterbalance spool fully open

Notice

- ▶ Pressure Δp of approx. 20 to 50 bar is normal for determining the maximum flow in winch drives.
- ▶ If the desired flow (pressure difference) does not match the counterbalance spool described here, please contact us.

Functional description

Counterbalance valves are designed to reduce the danger of overspeed and cavitation of axial piston motors in open circuits. Cavitation occurs if, during braking or load-lowering, the rotational speed of the motor is greater than it should be for the given inlet flow, causing the supply pressure to fall sharply. If the supply pressure drops below the given value Δp_{KE} , the counterbalance spool will move towards the close position. The cross-sectional area in the counterbalance valve return channel is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor reaches the specified value for the given inlet flow.

The counterbalance valve is available in two versions.

BVD: Throttling effect in both flow directions, e.g. for moving forward and backward

BVE: Throttling effect in one flow direction, e.g. for lowering with pulling loads

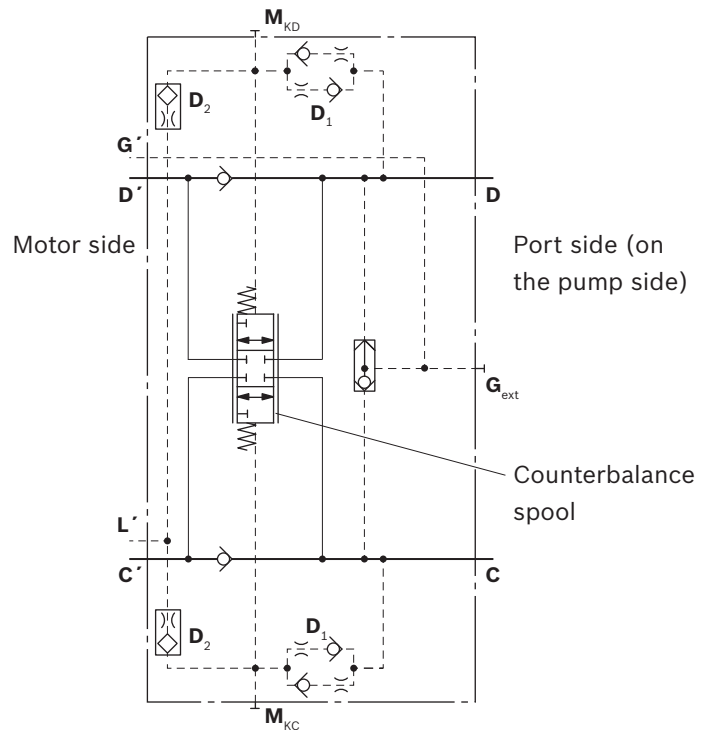

See BVE circuit diagram on page 7

Brake release

Version S

Counterbalance valve with shuttle valve and port **G_{ext}** (plugged), without brake release valve (pressure reduction). The respective high pressure is balanced via the shuttle valve and is available at port **G_{ext}** for venting the mechanical holding brake. The brake vent function without pressure reduction via the brake release valve is only employed if the mechanical holding brake is approved for the maximum working pressure.

▼ Circuit diagram BVD...S

Version L

Counterbalance valve with shuttle valve, brake release valve for pressure reduction and port **Br** (plugged).

The respective high pressure is balanced and fed to the brake release valve (pressure reducing valve) via the shuttle valve. This opens from approx. 10 bar and reduces the respective working pressure to approx. 21^{+4} bar. This brake vent function is employed when the mechanical brake on the gear unit cannot handle the full system pressure.

The maximum permissible brake release pressure must be agreed with the winch or track drive manufacturer.

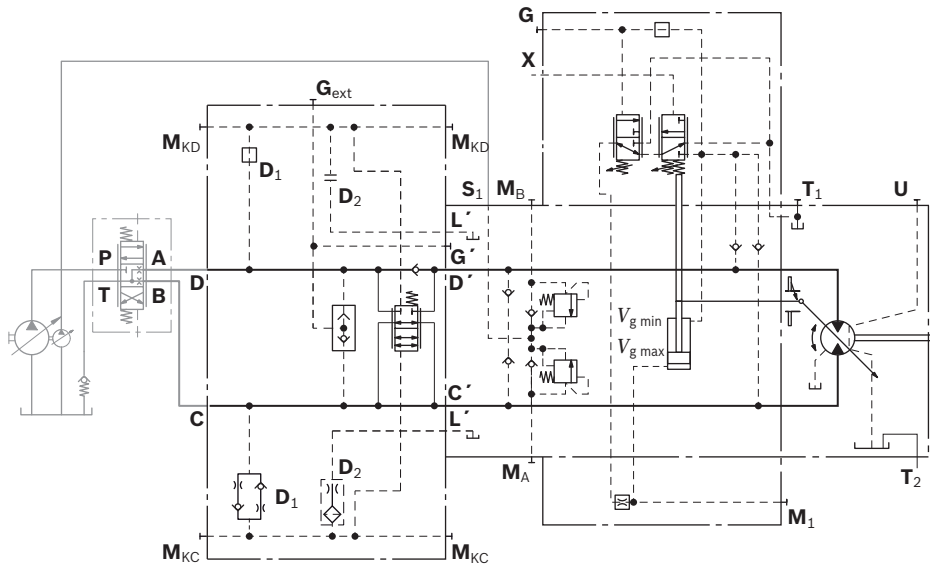

Example applications

Variable motor with integrated pressure relief valve in the port plate and mounted counterbalance valve.

Counterbalance valve for size 32 winches, without brake release valve (S), with counterbalance spool (pos. 10), without internal residual opening (K00, mandatory for winches), with weak damping (D4599). E.g.: A6VM215HP5D1P001B/71MWW0S4A29W0-0 + BVE32W38S/52ND-V330K00C4599D03S00 mounted to a Rexroth winch gearbox

Winch drive application

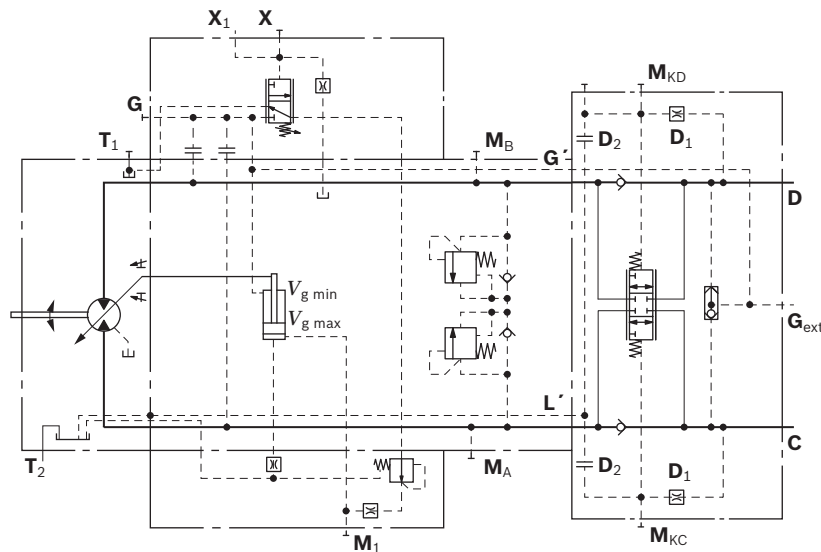

► Circuit diagram example for winch drive in cranes (BVE)

As an alternative to the above example, other Bosch Rexroth axial piston motors (A6VM and A6VE) can also be used.

Track drive application

► Circuit diagram example for track drive in excavator crawlers (BVD)

Dimensions

Long spring cover on port side C, lift via port C

1) DIN912

Long spring cover on port side D, lift via port D

1) DIN912

Ports		Standard	Size	p_{\max} [bar] ¹⁾	State ⁵⁾
C, D	Working port	SAE J518 ²⁾	1 1/4 in	400	O
	Fastening thread	DIN 13	M14 × 2; 19 deep		
G _{ext}	Brake release, high pressure	DIN 3852 ³⁾	M14 × 1.5; 12 deep	400	X

¹⁾ The throttling effect is always on the side with the long spring cover

Mounting of the counterbalance valve

When delivered, the counterbalance valve is fastened to the motor with two tacking screws (transport lock). The tacking screws may not be removed while mounting the working lines!

If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be fastened to the motor port plate using the provided tacking screws.

The counterbalance valve is finally mounted to the motor by fitting the SAE flange with the following screws:

6 screws (1, 2, 3, 4, 5, 8) Length B1+B2+B3

2 screws (6, 7) Length B3+B4

Tighten the screws in two steps in the specified sequence from 1 to 8 (see figure below).

In the first step, the screws must be tightened with half the tightening torque, and in the second step with the maximum tightening torque (see table below).

Thread	Property class	Tightening torque [Nm] ¹⁾
M14	10.9	172

Axial piston motor	A6VM/65	A6VE/65	A6VM/71	A6VE/71
Size	200	200	215, 280	215
Dimension B1	M14 × 2; (19 deep ¹⁾)			
Dimension B2	154 -0.5			
Dimension B3	Customer-specific			
Dimension B4	M14 × 2; 19 deep			

Notes on the motor port plate

- ▶ All four threaded bores at the SAE port and additional bores for tacking screws must always be present
- ▶ Drain bores and port G_{ext} must be present
- ▶ Minimum thread reach according to VDI2230

1) The tightening torque applies to the thread friction rate of $\mu = 0.10$ (corresponds to the "lightly oiled" state of the screws)

2) The depth depends on the motor

Project planning notes

- ▶ The BVD/BVE counterbalance valve is intended for use in an open circuit.
- ▶ The project planning, installation and commissioning of the counterbalance valve require the involvement of qualified skilled personnel.
- ▶ Before using the counterbalance valve, please read the corresponding motor instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes contained herein must be observed.
- ▶ For safety reasons, controls with beginning of control at $V_{g \min}$ (e.g., HA) are not permissible for winch drives, e.g. anchor winches.
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or the motor instruction manual.
- ▶ Not all versions of the product are approved for use in a safety function according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. $MTTF_d$) for functional safety.
- ▶ Please note the details regarding the tightening torques of port threads and other threaded joints in the motor instruction manual.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure of the counterbalance valve. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports are only intended to accommodate hydraulic lines.
- ▶ System optimization (reduction) for the first prototype is recommended with regard to the valve block, axial piston motor, counterbalance valve and holding brake.
- ▶ The counterbalance valve converts the entire kinetic energy/potential energy into heat during the braking/lowering process. For this reason, sufficient cooling and/or reservoir capacity must be provided.
- ▶ We recommend ordering an axial piston motor and counterbalance valve as a single unit. This guarantees optimum configuration and joint examination.

To avoid cavitation in the axial piston motor, the following must be observed:

- ▶ The complete system must be designed in the customer vehicle so that the counterbalance valve closes more quickly than the control block in the customer vehicle. The recommendation is a proportional valve with programmable ramp.
- ▶ Control block: the control spool should be designed with a throttled A-B-T connection in the neutral position.
- ▶ An oil supply at port S of the motor reduces the risk of cavitation. Ensure sufficient supply pressure and quantity. An oil supply on the motor is recommended.
- ▶ During commissioning, it must be ensured that all boundary conditions, e.g. minimum pressure at the motor input, are observed.

Ordering details

When placing the order, the following parameters are necessary to ensure correct acceptance at our test benches:

- ▶ Motor type code
- ▶ Counterbalance valve type code
- ▶ Flow
- ▶ Application (e.g. winch, track drive)
- ▶ Pressure setting of the secondary pressure relief valves in the motor

For the design of the brake release valve, we require the minimum pressure for releasing the mechanical holding brake. Counterbalance valve and axial piston motor can be ordered as a ready-assembled and tested assembly group.

Type selection (type code)**Control range**

The control range defines the pressure range at which the counterbalance spool starts to open. The control range of the counterbalance spool is to be chosen so that the mechanical holding brake is fully open before the counterbalance spool starts to open.

Brake release

The integrated pressure reducing valve is necessary when the mechanical brake on the gearbox cannot handle the full system pressure. The maximum permissible brake release pressure must be agreed with the gearbox manufacturer. The counterbalance valve reduces the high pressure to the value stated.

Counterbalance spool version

The counterbalance spool version depends on the maximum flow required through the counterbalance valve. Selection of the counterbalance spool for the required flow in accordance with characteristic curves on page 5. If the desired flow is not within the range of the counterbalance spool supplied, please contact us.

Residual opening in counterbalance spool

In winch drive and track drive applications, any residual opening is prohibited, since otherwise the load would not stay suspended. For that reason, version "K00" is prescribed.

Damping

The throttle pin from D1 (inlet) and the orifice D2 (reservoir outlet), plus the counter pressure at the counterbalance spool, determine the actual cracking pressure of the counterbalance spool at the working port.

The damping D1 (outlet) and D2 determine the closing speed of the counterbalance spool. The larger the comparative diameter D1 (outlet), the faster the counterbalance spool will close (see table on page 4).

For the initial equipment (prototype), we recommend damping D1 = D4599 and D2 = T03 for winch drives.

For the initial equipment (prototype), we recommend damping D1 = D4599 and D2 = T00 for track drives.

Safety instructions

Failure to observe any of the following points can lead to uncontrolled operating conditions with serious personal injury and material damage.

- ▶ The counterbalance valve does **not** replace the mechanical holding brake. If necessary, provide mechanical braking systems.
- ▶ The mechanical holding brake in the winch gearbox must only be effective after the counterbalance spool has closed. Otherwise, the brake will be subject to wear.
- ▶ Note the maximum permissible cracking pressure of the holding brake. If necessary, use the integrated pressure reducing valve as a brake release valve with reduced high pressure (version “L”).
- ▶ Counterbalance valves should only be operated in combination with close-by secondary pressure relief valves in order to protect the motor against pressure peaks. The motor port plate already contains the secondary pressure relief valves.
- ▶ Cavitation must be prevented for safety reasons – see project planning notes for remedial measures
- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve spools) can, under certain circumstances get stuck in position as a result of contamination (e.g. impure hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filter) will not rule out a fault but merely reduce the risk.
The machine/system manufacturer must test whether remedial measures are needed on the machine for the application concerned in order to set the consumer being driven to a safe position (e.g. safe stop) and if necessary to ensure it is properly implemented.
- ▶ Moving parts in high-pressure relief valves may in certain circumstances become stuck in an undefined position due to contamination (e.g. contaminated hydraulic fluid). This can result in restriction or loss of the load holding function in lifting winches.
The machine/system manufacturer must check whether additional measures are required on the machine for the relevant application in order to keep the load in a safe position and ensure they are properly implemented.
- ▶ When using the axial piston motor in winch drives, make certain that the technical limit values are not exceeded under all operating conditions. If the axial piston motor is extremely overloaded (e.g., if the maximum permissible rotational speeds are exceeded during weighing of the anchor while the ship is in motion), the rotary group may be damaged and, in the worst case, the axial piston motor may burst. The machine manufacturer/system manufacturer is to undertake additional measures, up to and including encapsulation.

External gear motors

Designation	Type	Size	Serie	Data sheet	Page
External gear motor High Performance	AZMB	1...7.1	3x	14027	679

Functional description

General

If pressurized oil is fed into the motor, a torque can be obtained from the shaft leading out of the housing. Motors can be either for one direction of rotation or reversible.

Gear motor for one direction of rotation

These gear motors are designed asymmetrically, i.e., fixed high-pressure and low-pressure ends. This means they cannot be reversed. Motors require a special start-up sequence to ensure good efficiency. Any leakage oil is drained internally. The shaft seal limits drainage pressure.

Reversible gear motor

The displacement principle of external gear motors is the opposite of that of pumps. Reversible motors are an exception to this concept. Due to their symmetrical layout, the high-pressure and low-pressure chambers are separate from the bearing and shaft seal chambers. Any leakage oil is drained through a separate drain port in the housing cover. This drainage allows the motor to run in reverse, making series connections possible. Standard motors and pumps can only withstand up to approx. 3 bar due to the connection between the shaft seal and the low-pressure end.

The figure shows a reversible motor for four-quadrant operation, i.e., output torque and drive torque in both directions (hydraulic motor functions as a pump when the load is reversed).

Output drives

1. Elastic couplings

- ▶ The coupling should not transfer any radial or axial forces to the motor.
- ▶ The maximum radial run-out from the shaft to the spigot should not exceed 0.2 mm.
- ▶ See the coupling manufacturer's assembly instructions for permissible shaft misalignments.

2. Coupling dog

- ▶ For attaching the motor directly to a gear, etc.
- ▶ Motor drive shaft with special coupling dog and driver (3)
- ▶ No shaft seal
- ▶ Output side installation and sealing according to following recommendations and dimensions

Drive shaft	M_{max} [Nm]	Size	p_{max} [bar]
C	26	2.5 to 5.0	270
		6.3	230
		7.1	205
H	30	2.5 to 6.3	270
		7.1	235
N	25	2.5 to 5.0	270
		6.3	225
		7.1	200

▶ Output shaft on the customer side (1)

- Case-hardening steel as per DIN 17210 e.g., 20 MnCrS 5 case-hardened 0.6 deep; HRC 60^{±3}
- Seal ring running surface ground without rifling
 $R_{max} \leq 4 \mu m$

▶ Radial shaft seal on the customer side (2)

- Provide with rubber cover (see DIN 3760, type AS, or double-lipped ring)
- When designing the installation space, note the seal manufacturer's design guidelines.

Gear motors with integrated valves

In order to reduce pipework, a pressure relief valve can be integrated into the cover of the gear motor.

Notes on commissioning

General

Motors delivered by Bosch Rexroth are tested for function and performance. Any modifications will void the warranty. The motor should only be operated with the permissible data (see page 4).

Technical data

All specified technical data depends on manufacturing tolerances and apply under certain general conditions. Note that this can result in some variance and that technical data may also vary under certain general conditions (e.g., viscosity).

Characteristic curves

When dimensioning the gear motor, observe the maximum possible application data based on the characteristic curves starting on page 6.

Scope of delivery

The scope of delivery includes the components with the characteristics described under type codes and dimensions starting on page 11.

Further information

- ▶ Further information on installation, commissioning, and operation can be found in the publication 07012-B1: "General Instruction Manual for External Gear Units".
- ▶ Extensive notes and suggestions can be found in the Hydraulic Trainer Vol. 3: "Project planning recommendations and design of hydraulic systems", order number R900018547.

Filter recommendation

Since the majority of premature failures in gear motors occur due to contaminated hydraulic fluid, filtration should maintain a cleanliness level of 20/18/15 as defined by ISO 4406. Cleanliness level 20/18/15 can reduce contamination to an acceptable degree in terms of particle size and concentration.

Bosch Rexroth generally recommends full-flow filtration. Basic contamination of the hydraulic fluid should not exceed class 20/18/15 as defined by ISO 4406. New fluids are often above this value. In such instances, a filling device with a special filter should be used.

Bosch Rexroth is not liable for wear due to contamination.

AZ configurator

With our practical product selector, it will take you next to no time to find the right solution for your applications, no matter whether it is High Performance or another external gear unit.

The selector guides you through a selection of features to all of the products available for order. By clicking on the order number, you can view and download the following product information: Data sheet, dimension sheet, instruction manual, operating conditions, and tightening torques. You can order your selection directly via our online shop and at the same time benefit from an additional discount of 2%. And if you need something really quickly, simply use our fast delivery and preferred programs (GoTo). Then the goods will be sent within 10 business days.

You also have the possibility to easily and conveniently configure your individual external gear unit with our AZ configurator. All the necessary data that you need for the project planning of external gear units is requested by means of the menu navigation.

For an already existing configuration you receive as a result the order number, the type code, as well as further information. If your configuration does not lead to a product that is available for order, our online tools provide you with the possibility of sending a project request directly to Bosch Rexroth. We will then get in contact with you.

Fit4SILENCE app

You want to quickly determine the noise level of an application but don't have a measuring device at hand? No problem with Fit4SILENCE! Our new noise measurement app for all Android devices can be immediately downloaded free of charge. After calibration, you can start using it straight away and conduct fast, accurate noise measurements with different weightings in no time at all. An additional measuring device is no longer necessary, because calibrated smartphones using the app can achieve an accuracy that approximates professional measuring devices.

Last but not least, the app contains interesting information about the SILENCE PLUS technology, including an audio sample.

General

Rexroth external gear motors are produced in 3 different models, with different displacements being produced by means of gears of differing widths.

Different versions of motors are achieved by the use of different flanges, shafts, valves and integrated speed sensors.

Features

- High pressures combined with small size and low weight
- Large speed ranges
- Broad viscosity and temperature ranges
- Reversible motors for 2- and 4-quadrant operation

Fields of application

- Road construction machines as road rollers and pavers
- Agricultural machines and forestry technology as harvesters and forestry machines
- Street vehicles such as busses, trucks and special vehicles and above all in hydrostatic fan drives.

Function

If pressurized oil is fed into the motor, a torque can be obtained from the shaft leading out of the housing. Here, a distinction is made between motors that rotate on one direction and reversible motors.

External gear motors that rotate in one direction

These are of asymmetrical design, i.e. the high and low pressure sides are defined and not interchangeable at will. In this case, reversible operation is not possible. In order to ensure a high efficiency level, a special running-in method is used for motors. Leakage oil is discharged internally to the outlet side. Pressure loading of the outlet is limited by the shaft seal.

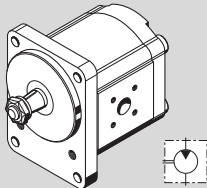

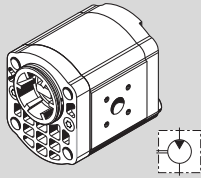

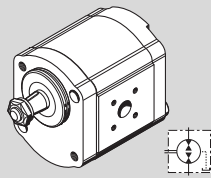

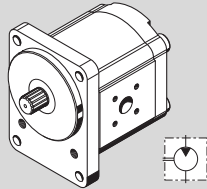

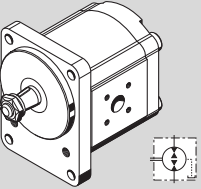

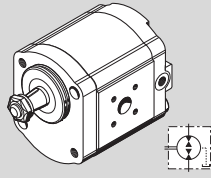

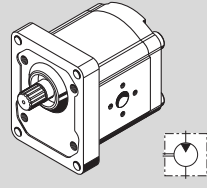

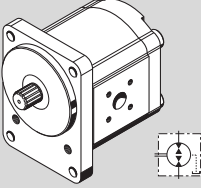

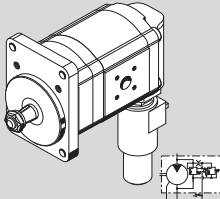

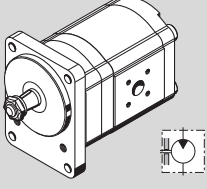

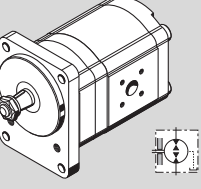

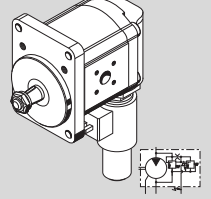

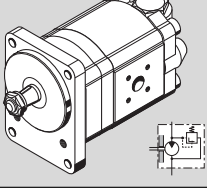

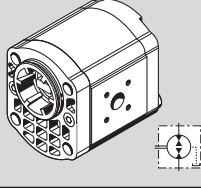

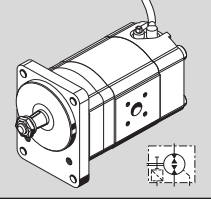

Reversible external gear motors

The displacement method in external gear motors is the reverse of the pump process. Reversible motors have a special feature, however. Their symmetrical construction means that the high or low pressure chambers are separate from the bearing and shaft seal chamber. The resulting leakage oil is routed through a separate oil drain gland in the housing cover. This oil drainage enables the motor to be subjected to load via the return line, which in turn allows the use of series connections. Due to the connection between the shaft seal and the low-pressure end, however, standard motors and pumps can only withstand a pressure of up to approx. 3 bar.

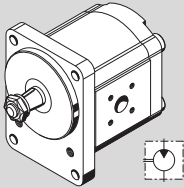

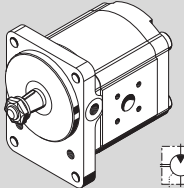

The figure shows a reversible gear motor for 4-quadrant operation, i.e. both output and input torque in both directions. (Hydraulic motor becomes a pump if load reversal occurs.)

External gear motors with integrated valves, sensors

Pages 31, 32

Gear motor with integrated, pilot-operated proportional pressure relief valve and rotary shaft seal relieved of load thanks to the three-chamber design.

The use of gear motors without this relief of the rotary shaft seal is not recommended due to the loads from the oil return line, particularly when the oil is cold. The basis of this drive unit is a motor model "F". The pilot proportional pressure relief valve is integrated in the rear end cover. This unit has the following advantages:

- No pipework necessary for the functioning of the prop. pressure relief valve
- Integrated pressure relief
- Fail-safe function in the event of power loss
- Drag speed virtually zero
- Motor speed prop. controllable
- Unaffected by pressure loads from the outlet

External gear motors with pressure relief valve

Page 23

return port pressure < 3 bar (10 bar at starting)

External gear motors with integrated speed sensor

Page 34

The DSM1-10 Hall-effect speed sensor was specially developed for tough use in mobile work machines. The sensor detects the speed signal of ferromagnetic gear wheels. In this process, as an active sensor, it supplies a signal with constant amplitude independent of the rotational speed. Due to its compact, sturdy design, the gear motor with integrated sensor is suitable for the applications such as

- In fan drives for buses, trucks and construction machinery from 7 to 20 kW
- As a vibration drive for road rollers and road construction machinery

Design calculations for motors

The design calculations for motors are based on the following parameters:

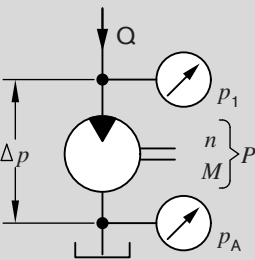

V [cm ³ /rev]	Displacement
Q [l/min]	Inlet flow rate
p [bar]	Pressure (p_1, p_A)
M [Nm]	Output torque
n [rev/min]	Output speed
P [kW]	Output power

It is also necessary to allow for different efficiencies such as:

η_v	Volumetric efficiency
η_{hm}	Mechanical-hydraulic efficiency
η_t	Total efficiency

The following formulas describe the various relationships. They include correction factors for adapting the parameters to the usual units encountered in practice.

Note: Diagrams providing approximate selection data can be found on subsequent pages. These graphs contain the levels of efficiency in each case.

$$Q = \frac{V \cdot n}{\eta_v} \cdot 10^{-1}$$

$$\Delta p = \frac{M}{1.59 \cdot V \cdot \eta_{hm}} \cdot 10^4$$

$$P = \frac{Q \cdot \Delta p \cdot \eta_t}{6} \cdot 10^{-4}$$

$$V = \frac{Q \cdot \eta_v}{n} \cdot 10$$

$$V = 1.59 \cdot \frac{M}{\Delta p \cdot \eta_{hm}} \cdot 10^4$$

$$n = \frac{Q \cdot \eta_v}{V} \cdot 10$$

$$M = 1.59 \cdot V \cdot \Delta p \cdot \eta_{hm} \cdot 10^{-4}$$

	[%]					
Q	— η_v —>	n	V [cm ³ /rev]	Q [l/min]	Δp [bar]	Note: η [%]
Δp	— η_{hm} —>	M	n [rev/min]	P [kW]	M [Nm]	
$\Delta p \cdot Q$	— η_t —>	P				

Diagrams Model "F"

$v = 35 \text{ mm}^2/\text{s}, T = 50 \text{ }^\circ\text{C}$

Diagrams Model "N"

$v = 35 \text{ mm}^2/\text{s}, T = 50 \text{ }^\circ\text{C}$

$Q = f(n, V)$ incl. η_v
 $P = f(n, p)$ ——— incl. η_t
 $M = f(n, p)$ - - - incl. η_{hm}

Diagrams Model "G"

$v = 35 \text{ mm}^2/\text{s}, T = 50 \text{ }^\circ\text{C}$

Specifications

General	
Construction	external gear motor
Mounting	Flange or through-bolting with spigot
Port connections	screw, flange
Direction of rotation (looking on shaft)	One direction of rotation or reversible
Mounting position	any
Load on shaft	radial and axial forces after consulting
Ambient temperature range	-30 °C...+80 °C with NBR seals*) -20 °C...+110 °C with FPM seals**)
Fluids	mineral oil-based hydraulic fluids to DIN/ISO, other fluids upon request
Viscosity	12...800 mm ² /s permitted range 20...100 mm ² /s recommended range ...2,000 mm ² /s permitted for starting
Fluid temperature range	max. +80 °C with NBR seals*) max. 110 °C with FPM seals**)
Filter ***)	contamination at least class 19/16 according to ISO 4406 to be obtained with filter b20 = 75. For higher lifespan demands we recommend a correspondingly higher filter class.

*) NBR = Perbunan®

**) FPM = Viton®

***) During the application of control systems or devices with critical counter-reaction, such as steering and brake valves, the type of filtration selected must be adapted to the sensitivity of these devices/systems.

Safety requirements pertaining to the whole systems are to be observed.

In the case of applications with frequent load cycles please consult us.

Model F

Displacement	cm ³ /rev	5.5 ¹⁾	8	11	14	16	19	22.5
max. continuous pressure p_1	bar	250						180
max. starting pressure p_2		280						210
min. rotational speed	min ⁻¹	500						
max. rotational speed p_1		4,000		3,500	3,000			
Motor outlet pressure p_A Leakage-oil line pressure p_L	bar

Motor outlet pressure p_A Leakage-oil line pressure p_L	bar					

1) On request *) Short-term when starting 10 bar

Power take-off

1. Flexible couplings

The coupling must not transfer any radial or axial forces to the motor.

The maximum radial run out of shaft spigot is 0.2 mm.

Refer to the fitting instructions provided by the coupling manufacturer for details of the maximum permitted shaft misalignment.

2. Sleeve couplings

Used on shafts with DIN or SAE splining.

Note: There must be no radial or axial forces exerted on the motor or sleeve coupling. The sleeve must be free to move axially. The distance between the motor shaft and drive shaft must be 2^{+1} . Oil-bath or oil-mist lubrication is necessary.

Spline shaft	$M_{max.}$ [Nm]	V [cm ³ /rev]	$p_{max.}$ [bar]
DIN	190	8...22.5	$p_{max.}$
SAE	130		

3. Drive shaft with tang

For the close-coupling of the motors to gearboxes, etc. the motor's shaft has a special drive shaft with tang which combines with a center coupling ③. There is no shaft seal.

The recommended arrangements and dimensions for the drive end and sealing are as follows.

① Drive shaft

Case-hardened steel DIN 17 210, e.g. 20 MnCrS 5 case-hardened 0.6 deep; HRC 60 ±3. Surface for sealing ring ground without rifling $R_{max.} \leq 4\mu\text{m}$

② Radial shaft seal

Rubber-covered seal (see DIN 3760, Type AS or double-lipped ring). Cut 15° chamfer or fit shaft seal with protective sleeve.

$M_{max.}$ [Nm]	V [cm ³ /rev]	$p_{max.}$ [bar]
65	8...14	280
	16	230
	19	190
	22.5	160

4. Outboard bearing Model "F"

Outboard bearings eliminate possible problems when the motors are driven by V-belts or gearwheels. The diagrams below show the maximum overhung and thrust loads that can be tolerated, referring to a bearing life of $L_H = 1,000$ hours.

$M_{max.}$ [Nm]	V [cm ³ /rev]	$p_{max.}$ [bar]
65	16	230
	19	190
	22.5	160

Notes

Filter recommendation

The major share of premature failures in external gear motors is caused by contaminated pressure fluid.

As a warranty cannot be issued for dirt-specific wear, we recommend filtration compliant with cleanliness level 20/18/15 ISO 4406, which reduces the degree of contamination to a permissible dimension in terms of the size and concentration of dirt particles:

Operating pressure [bar]	>160	<160
Contamination class NAS 1638	9	10
Contamination class ISO 4406	18/15	19/16
To be reached with $\beta_x = 75$	20	25

We recommend that a full-flow filter always be used. Basic contamination of the pressure fluid used may not exceed class 20/18/15 according to ISO 4406. Experience has shown that new fluid quite often lies above this value. In such instances a filling device with special filter should be used.

General

- The motors supplied by us have been checked for function and performance. No modifications of any kind may be made to the pumps; any such changes will render the warranty null and void!
- Motor may only be operated in compliance with permitted data (see pages 14 – 18).

Project planning notes

Comprehensive notes and suggestions are available in Hydraulics Trainer, Volume 3 RE 00 281, "Project planning notes and design of hydraulic systems". Where external gear motors are used we recommend that the following note be adhered to.

Technical data

All stated technical data is dependent on production tolerances and is valid for specific marginal conditions.

Note that, as a consequence, scattering is possible, and at certain marginal conditions (e.g. viscosity) **the technical data may change.**

Characteristics

When designing the external gear motor, note the maximum possible service data based on the characteristics displayed on pages 10 to 14.

Additional information on the proper handling of hydraulic products from Bosch Rexroth is available in our document: "General product information for hydraulic products" RE 07 008.

Leakage oil line

A leakage oil line must be connected directly to the tank in reversible motors or motors stressed by run-back. Observe sufficient dimensions.

Contained in delivery

The components with characteristics as described under device measurements and ordering code, pages 19 – 39, are contained in delivery.

You can find further information in our publication: "General Operating Instructions for External Gear Units" RE 07 012-B1.

Radial piston motor for frame integrated drives MCR-A

- ▶ Frame size MCR3, MCR5, MCR10, MCR15
- ▶ Displacement 160 cc to 2150 cc
- ▶ Differential pressure up to 450 bar
- ▶ Torque output up to 13687 Nm
- ▶ Speed up to 875 rpm
- ▶ Open and closed circuits

Features

- ▶ Compact robust construction
- ▶ High volumetric and mechanical efficiencies
- ▶ Front case mount
- ▶ Splined drive shaft
- ▶ High reliability
- ▶ Low maintenance
- ▶ Smooth running at very low speeds
- ▶ Low noise
- ▶ Bi-directional
- ▶ Sealed tapered roller bearings
- ▶ Freewheeling possible
- ▶ Available with:
 - Holding brake (multi-disc)
 - Bi-directional two speed
 - Integrated flushing valve
 - Speed sensor

Functional description

Hydraulic motors of the type MCR-A are radial piston motors with front case mounting and splined drive shaft. The MCR-A motors are intended for open or closed circuit operations as drive motors for the chain drive function primarily on skid steer loaders. A-type motors can be used for a variety of applications depending on the attachment that can be mounted on the spline shaft of the motor (e. g. gear drive, sprocket, chain drive).

Construction

Two part housing (1, 2), rotary group (3, 4, 8), cam (5), drive shaft (6) and flow distributor (7)

Transmission

The cylinder block (4) is connected to the shaft (6) by means of splines. The pistons (3) are arranged radially in the cylinder block (4) and make contact with the cam (5) via rollers (8).

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

The ports A and B, which are located in the rear case, carry oil through the distributor to the cylinder chambers (E).

Bearings

Tapered roller bearings capable of transmitting high axial and radial forces are fitted as standard.

Freewheeling

In certain applications there may be a requirement to free-wheel the motor. This may be achieved by connecting ports A and B to zero pressure and simultaneously applying a pressure of 2 bar to the housing through port L. In this condition, the pistons are forced into the cylinder block which forces the rollers to lose contact with the cam thus allowing free rotation of the shaft.

Two speed operation (2W)

In mobile applications where vehicles are required to operate at high speed with low motor loads, the motor can be switched to a low-torque and high-speed mode. This is achieved by operating an integrated valve which directs hydraulic fluid to only one half of the motor while continuously re-circulating the fluid in the other half. This “reduced displacement” mode reduces the flow required for a given speed and gives the potential for cost and efficiency improvements. The motor maximum speed remains unchanged.

Bosch Rexroth has developed a special spool valve to allow smooth switching to reduced displacement whilst on the move. This is known as “soft-shift” and is a standard feature of 2W motors. The spool valve requires either an additional sequence valve or electro-proportional control to operate in “soft-shift” mode.

▼ Schematic

Flushing valve

In a closed circuit, the same hydraulic fluid continuously flows between the pump and the motor. This could therefore lead to overheating of the hydraulic fluid.

The function of the flushing valve option is to replace hydraulic fluid in the closed circuit with that from the reservoir. When the hydraulic motor is operated under load, either in the clockwise or anti-clockwise direction, the flushing valve opens and takes a fixed flow of fluid through an orifice from the low pressure side of the circuit. This flow is then fed to the motor housing and back to the reservoir normally via a cooler. In order to charge the low pressure side of the circuit, cool fluid is drawn from the reservoir by the boost pump and is fed to the pump inlet through the check valve. Thus the flushing valve ensures a continuous renewal and cooling of the hydraulic fluid. The flushing feature incorporates a relief valve which is used to maintain a minimum boost pressure and operates at a standard setting of 14 bar (other options available on request).

Different orifice sizes may be used to select varying flows of flushing fluid. The following table gives flushing rate values based on a boost / charge pressure of 25 bar.

▼ Schematic

Flushing flow rates

Flushing code	Orifice size (mm)	Flow (l/min) at 25 bar ¹⁾	
		min	max
F1	Ø1	2.2	2.7
F2	Ø1.5	5.0	6.1
F7	Ø1.7	6.4	7.8
F4	Ø2	8.2	10.7
F6	Ø2.3	8.8	11.4

1) 0.6 mm Shim (Standard), Cracking pressure = 11±3 bar

Holding brake (multi-disc brake)

Mounting

By way of rear housing (2) and brake shaft (14).

Brake application

As a safety requirement in mobile applications a parking brake may be provided to ensure that the motor cannot turn when the machine is not in use. The parking brake provides holding torque by means of discs (11) that are compressed by a disc spring (10). The brake is released when oil pressure is applied to brake port "Z" and the pressure in the annular area (9) compresses the disc spring using brake piston (12) thus allowing the brake discs (11) to turn independently.

Note

This brake is provided solely for static use - not to be used dynamically.

▼ Schematic diagrams

Manual release of holding brake

The brake may also be released manually by loosening screws (13).

Speed sensor

A Hall-effect speed sensor (16) may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc (17) is fitted to the motor cylinder block (4), and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed.

Versions are available for use with regulated supplies 10 V (Code P1) and for direct connection to a 12 V or 24 V unregulated supply (Code P2).

The motor can also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These "sensor-ready" motors may be fitted with a sensor at a later date.

Direction of shaft rotation with flow

1) Not available for MCR10A

Footer from page 7

- 1) Ensure motor case is filled with oil prior to start-up.
- 2) For installation and maintenance details, please see instruction manual 15215-B.
- 3) For use with environmentally acceptable fluids HEES, HEPG, HETG, fluoroelastomer / Viton seals must be specified.
- 4) Extension of the allowable temperature range may be possible depending on specification. Please consult Bosch Rexroth Engineering Department in Glenrothes for further details.
- 5) Maximum values should only be applied for a small portion of the duty cycle. Please consult Bosch Rexroth Engineering Department in Glenrothes for motor life calculations based on particular operating cases.
- 6) When operating motors in series, please consult Bosch Rexroth Engineering Department in Glenrothes.
- 7) For continuous operation at speeds <5 rpm please consult Bosch Rexroth Engineering Department in Glenrothes.
- 8) Based on nominal no-load Δp of 20 bar in full-displacement mode.
- 9) Warning! During the running in period of the motor (min. 20 hrs) it should not be run unloaded at >100 rpm.

Note

- ▶ Motor performance values are based on theoretical calculations.
 - ▶ Efficiencies are not taken into consideration for theoretical calculations.
 - ▶ Brake torque accounts for tolerances. Values are based when used with standard mineral oil (HLP)
- Please refer the related foot notes for more details.

Radial piston motor for compact drives

MCR-C

- ▶ Frame size MCR20
- ▶ Displacement 1750 cc to 3000 cc
- ▶ Differential pressure up to 450 bar
- ▶ Torque output up to 19099 Nm
- ▶ Speed up to 125 rpm
- ▶ Open and closed circuits

Features

- ▶ Compact robust construction
- ▶ High volumetric and mechanical efficiencies
- ▶ Rear case mount
- ▶ Wheel flange with wheel studs
- ▶ High reliability
- ▶ Low maintenance
- ▶ Smooth running at very low speeds
- ▶ Low noise
- ▶ Bi-directional
- ▶ Sealed tapered roller bearings
- ▶ Freewheeling possible
- ▶ Available with:
 - Holding brake (multi-disc)
 - Bi-directional two speed
 - Integrated flushing valve
 - Speed sensor

Functional description

Hydraulic motors of the type MCR-C are radial piston motors with rear case mounting and flanged drive shaft. These motors have a compact front housing and are intended for drives in open or closed circuits. These motors are used in a wide range of applications where there is lower external loading. The integrated flange with wheel studs allows easy installation of standard wheel rims.

Construction

Two part housing (1, 2), rotary group (3, 4, 8), cam (5), drive shaft (6) and flow distributor (7).

Transmission

The cylinder block (4) is connected to the shaft (6) by means of splines. The pistons (8) are arranged radially in the cylinder block (4) and make contact with the cam (5) via rollers (3).

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

The ports A and B, which are located in the rear case, carry oil through the distributor to the cylinder chambers (E).

Bearings

Tapered roller bearings capable of transmitting high axial and radial forces are fitted as standard.

Freewheeling

In certain applications there may be a requirement to free-wheel the motor. This may be achieved by connecting ports A and B to zero pressure and simultaneously applying a pressure of 2 bar to the housing through port L. In this condition, the pistons are forced into the cylinder block which forces the rollers to lose contact with the cam thus allowing free rotation of the shaft.

Two speed operation (2W)

In mobile applications where vehicles are required to operate at high speed with low motor loads, the motor can be switched to a low-torque and high-speed mode. This is achieved by operating an integrated valve which directs hydraulic fluid to only one half of the motor while continuously re-circulating the fluid in the other half. This “reduced displacement” mode reduces the flow required for a given speed and gives the potential for cost and efficiency improvements. The motor maximum speed remains unchanged.

Bosch Rexroth has developed a special spool valve to allow smooth switching to reduced displacement whilst on the move. This is known as “soft-shift” and is a standard feature of 2W motors. The spool valve requires either an additional sequence valve or electro-proportional control to operate in “soft-shift” mode.

▼ Schematic

Flushing valve

In a closed circuit, the same hydraulic fluid continuously flows between the pump and the motor. This could therefore lead to overheating of the hydraulic fluid.

The function of the flushing valve option is to replace hydraulic fluid in the closed circuit with that from the reservoir. When the hydraulic motor is operated under load, either in the clockwise or counter-clockwise direction, the flushing valve opens and takes a fixed flow of fluid through an orifice from the low pressure side of the circuit. This flow is then fed to the motor housing and back to the reservoir normally via a cooler. In order to charge the low pressure side of the circuit, cool fluid is drawn from the reservoir by the boost pump and is fed to the pump inlet through the check valve. Thus the flushing valve ensures a continuous renewal and cooling of the hydraulic fluid. The flushing feature incorporates a relief valve which is used to maintain a minimum boost pressure and operates at a standard setting of 14 bar (other options available on request).

Different orifice sizes may be used to select varying flows of flushing fluid. The following table gives flushing rate values based on a boost / charge pressure of 25 bar.

▼ Schematic

Flushing flow rates

Flushing code	Orifice size (mm)	Flow (l/min) at 25 bar ¹⁾	
		min	max
F1	Ø1	2.2	2.7
F2	Ø1.5	5.0	6.1
F7	Ø1.7	6.4	7.8
F4	Ø2	8.2	10.7
F6	Ø2.3	8.8	11.4

1) 0.6 mm Shim (Standard), Cracking pressure = 11±3 bar

Holding brake (multi-disc brake)

Mounting

By way of rear housing (2) and brake shaft (14).

Brake application

As a safety requirement in mobile applications a parking brake may be provided to ensure that the motor cannot turn when the machine is not in use. The parking brake provides holding torque by means of discs (11) that are compressed by a disc spring (10). The brake is released when oil pressure is applied to brake port “Z” and the pressure in the annular area (9) compresses the disc spring using brake piston (12) thus allowing the brake discs (11) to turn independently.

Note

This brake is provided solely for static use - not to be used dynamically.

▼ Schematic diagrams

Manual release of holding brake

The brake may also be released manually by loosening screws (13).

Speed sensor

A Hall-effect speed sensor (16) may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc (17) is fitted to the motor cylinder block (4), and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed.

Versions are available for use with regulated supplies 10 V (Code P1) and for direct connection to a 12 V or 24 V unregulated supply (Code P2).

The motor can also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These “sensor-ready” motors may be fitted with a sensor at a later date.

Footer from page 7

- 1) Ensure motor case is filled with oil prior to start-up.
- 2) For installation and maintenance details, please see instruction manual 15215-B.
- 3) For use with environmentally acceptable fluids HEES, HEPG, HETG, fluoroelastomer / Viton seals must be specified.
- 4) Extension of the allowable temperature range may be possible depending on specification. Please consult Bosch Rexroth Engineering Department in Glenrothes for further details.
- 5) Maximum values should only be applied for a small portion of the duty cycle. Please consult Bosch Rexroth Engineering Department in Glenrothes for motor life calculations based on particular operating cases.
- 6) When operating motors in series, please consult Bosch Rexroth Engineering Department in Glenrothes.
- 7) For continuous operation at speeds <5 rpm please consult Bosch Rexroth Engineering Department in Glenrothes.
- 8) Based on nominal no-load Δp of 20 bar in full-displacement mode.
- 9) Warning! During the running in period of the motor (min. 20 hrs) it should not be run unloaded at >100 rpm.
- 10) Guide values for up to 5000 hours of motor operation (ISO VG46 at 50 °C).

Note

- ▶ Motor performance values are based on theoretical calculations.
 - ▶ Efficiencies are not taken into consideration for theoretical calculations.
 - ▶ Brake torque accounts for tolerances. Values are based when used with standard mineral oil (HLP)
- Please refer the related foot notes for more details.

Radial piston motor for wheel drives

MCR-F

- ▶ Frame size MCR3, MCR5, MCR10, MCR15 (for frame size 20 see MCR20-C)
- ▶ Displacement 160 cc to 2150 cc
- ▶ Differential pressure up to 450 bar
- ▶ Torque output up to 13687 Nm
- ▶ Speed up to 875 rpm
- ▶ Open and closed circuits

Features

- ▶ Compact robust construction
- ▶ High volumetric and mechanical efficiencies
- ▶ Rear case mount
- ▶ Wheel flange with wheel studs
- ▶ High reliability
- ▶ Low maintenance
- ▶ Smooth running at very low speeds
- ▶ Low noise
- ▶ Bi-directional
- ▶ Sealed tapered roller bearings
- ▶ High radial forces permitted on drive shaft
- ▶ Freewheeling possible
- ▶ Available with:
 - Holding brake (multi-disc) or dynamic (drum) brake
 - Bi-directional two speed
 - Integrated flushing valve
 - Speed sensor

Functional description

Hydraulic motors of the type MCR-F are radial piston motors with rear case mounting and flange shaft. The MCR-F motors are intended for wheel drives in open or closed circuits. These motors are used in a wide range of applications such as municipal vehicles, fork lift trucks, agricultural and forestry machines. The integrated flange with wheel studs allows easy installation of standard wheel rims.

Construction

Two part housing (1, 2), rotary group (3, 4, 8), cam (5), drive shaft (6) and flow distributor (7)

Transmission

The cylinder block (4) is connected to the shaft (6) by means of splines. The pistons (3) are arranged radially in the cylinder block (4) and make contact with the cam (5) via rollers (8).

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

The ports A and B, which are located in the rear case, carry oil through the distributor to the cylinder chambers (E).

Bearings

Tapered roller bearings capable of transmitting high axial and radial forces are fitted as standard.

Freewheeling

In certain applications there may be a requirement to free-wheel the motor. This may be achieved by connecting ports A and B to zero pressure and simultaneously applying a pressure of 2 bar to the housing through port L. In this condition, the pistons are forced into the cylinder block which forces the rollers to lose contact with the cam thus allowing free rotation of the shaft.

Two speed operation (2W)

In mobile applications where vehicles are required to operate at high speed with low motor loads, the motor can be switched to a low-torque and high-speed mode. This is achieved by operating an integrated valve which directs hydraulic fluid to only one half of the motor while continuously re-circulating the fluid in the other half. This “reduced displacement” mode reduces the flow required for a given speed and gives the potential for cost and efficiency improvements. The motor maximum speed remains unchanged.

Bosch Rexroth has developed a special spool valve to allow smooth switching to reduced displacement whilst on the move. This is known as “soft-shift” and is a standard feature of 2W motors. The spool valve requires either an additional sequence valve or electro-proportional control to operate in “soft-shift” mode.

▼ Schematic

Flushing valve

In a closed circuit, the same hydraulic fluid continuously flows between the pump and the motor. This could therefore lead to overheating of the hydraulic fluid.

The function of the flushing valve option is to replace hydraulic fluid in the closed circuit with that from the reservoir. When the hydraulic motor is operated under load, either in the clockwise or anti-clockwise direction, the flushing valve opens and takes a fixed flow of fluid through an orifice from the low pressure side of the circuit. This flow is then fed to the motor housing and back to the reservoir normally via a cooler. In order to charge the low pressure side of the circuit, cool fluid is drawn from the reservoir by the boost pump and is fed to the pump inlet through the check valve. Thus the flushing valve ensures a continuous renewal and cooling of the hydraulic fluid. The flushing feature incorporates a relief valve which is used to maintain a minimum boost pressure and operates at a standard setting of 14 bar (other options available on request).

Different orifice sizes may be used to select varying flows of flushing fluid. The following table gives flushing rate values based on a boost/charge pressure of 25 bar.

▼ Schematic

Flushing flow rates

Flushing code	Orifice size (mm)	Flow (l/min) at 25 bar ¹⁾	
		min	max
F1	Ø1	2.2	2.7
F2	Ø1.5	5.0	6.1
F7	Ø1.7	6.4	7.8
F4	Ø2	8.2	10.7
F6	Ø2.3	8.8	11.4

1) 0.6 mm Shim (Standard), Cracking pressure = 11±3 bar

Holding brake (multi-disc brake)

Mounting

By way of rear housing (2) and brake shaft (14).

Brake application

As a safety requirement in mobile applications a parking brake may be provided to ensure that the motor cannot turn when the machine is not in use. The parking brake provides holding torque by means of discs (11) that are compressed by a disc spring (10). The brake is released when oil pressure is applied to brake port "Z" and the pressure in the annular area (9) compresses the disc spring using brake piston (12) thus allowing the brake discs (11) to turn independently.

Note

This brake is provided solely for static use - not to be used dynamically.

▼ Schematic diagrams

Dynamic brake

Where mechanical dynamic braking is required, a drum brake may be specified. The drum brake is mounted directly onto the drive shaft (6) and front housing (1). Braking torque is provided by brake shoes acting on the inside of the drum.

The drum brake can also provide mechanical park brake function by use of bowden cable.

Manual release of holding brake

The brake may also be released manually by loosening screws (13).

Speed sensor

A Hall-effect speed sensor (**16**) may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc (**17**) is fitted to the motor cylinder block (**4**), and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed.

Versions are available for use with regulated supplies 10 V (Code P1) and for direct connection to a 12 V or 24 V unregulated supply (Code P2).

The motor can also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These “sensor-ready” motors may be fitted with a sensor at a later date.

Direction of shaft rotation with flow

(viewed from drive shaft)

- 2** Dynamic drum brake for use with brake fluid DOT 3+5 or SAE JI 703. If brake is to be used with mineral oil a special order is to be made. Please state if seals for mineral oil are required when placing order.

- 3** For use as a mechanical park brake a brake cable (Bowden cable) can be connected from right side for C*R and left side for C*L (left is s mirror image of the right type) (* = 2, 4, 7, 12). Mechanical brake cable is not supplied with the motor.

- 4** Brake cable length.

- 5** Angular position of brake cable.

Before finalizing your design, request a binding installation drawing.
Dimensions in mm.

Dynamic drum brake run-in procedure

- ▶ Brake the machine hard in forward and reverse directions until the brake drum temperature reaches 200 °C.
- ▶ Allow the brake to cool.
- ▶ To remove residue, brake gently 2 times each in the forward and reverse directions.

Note:
The drum brake cylinder port must be oriented as instructed in the installation drawing. The drum brake also has an influence on permitted radial loading due to its offset.

Radial piston motor for integrated drives

MCR-H

- ▶ Frame size MCR3, MCR5, MCR10, MCR15, MCR20
- ▶ Displacement 160 cc to 3000 cc
- ▶ Differential pressure up to 450 bar
- ▶ Torque output up to 19099 Nm
- ▶ Speed up to 875 rpm
- ▶ Open and closed circuits

Features

- ▶ Hydrobase motor
- ▶ Optimised design for integration
- ▶ Compact installation in customer structure
- ▶ High volumetric and mechanical efficiencies
- ▶ High reliability
- ▶ Low maintenance
- ▶ Smooth running at very low speeds
- ▶ Low noise
- ▶ Bi-directional
- ▶ Freewheeling possible
- ▶ Available with:
 - Holding brake (multi-disc)
 - Bi-directional two speed
 - Integrated flushing valve
 - Speed sensor

Functional description

Hydraulic motors of the type MCR-H are radial piston motors with a hydraulic rotary group as the base (Hydro-base) and a rear case sub assembly. These motors are intended for various integrated drive applications in open or closed circuits where the front case, shaft and bearing arrangement of the motor are provided by the customer structure. Some of the applications in which these motors are used are construction machinery, fork lift trucks, forestry machines and industrial applications. The compact design allows installation to very confined spaces and contributes in weight savings.

Construction

Rear case (2), rotary group (3, 4, 8), cam (5) and flow distributor (7)

Transmission

The cylinder block (4) is connected to the shaft located in the customer structure to which the motor is mounted by means of splines. The pistons (3) are arranged radially in the cylinder block (4) and make contact with the cam (5) via rollers (8).

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

The ports A and B, which are located in the rear case, carry oil through the distributor to the cylinder chambers (E).

Freewheeling

In certain applications there may be a requirement to free-wheel the motor. This may be achieved by connecting ports A and B to zero pressure and simultaneously applying a pressure of 2 bar to the housing through port L. In this condition, the pistons are forced into the cylinder block which forces the rollers to lose contact with the cam thus allowing free rotation of the shaft.

Two speed operation (2W)

In mobile applications where vehicles are required to operate at high speed with low motor loads, the motor can be switched to a low-torque and high-speed mode. This is achieved by operating an integrated valve which directs hydraulic fluid to only one half of the motor while continuously re-circulating the fluid in the other half. This “reduced displacement” mode reduces the flow required for a given speed and gives the potential for cost and efficiency improvements. The motor maximum speed remains unchanged.

Bosch Rexroth has developed a special spool valve to allow smooth switching to reduced displacement whilst on the move. This is known as “soft-shift” and is a standard feature of 2W motors. The spool valve requires either an additional sequence valve or electro-proportional control to operate in “soft-shift” mode.

▼ Schematic

Flushing valve

In a closed circuit, the same hydraulic fluid continuously flows between the pump and the motor. This could therefore lead to overheating of the hydraulic fluid.

The function of the flushing valve option is to replace hydraulic fluid in the closed circuit with that from the reservoir. When the hydraulic motor is operated under load, either in the clockwise or anti-clockwise direction, the flushing valve opens and takes a fixed flow of fluid through an orifice from the low pressure side of the circuit. This flow is then fed to the motor housing and back to the reservoir normally via a cooler. In order to charge the low pressure side of the circuit, cool fluid is drawn from the reservoir by the boost pump and is fed to the pump inlet through the check valve. Thus the flushing valve ensures a continuous renewal and cooling of the hydraulic fluid. The flushing feature incorporates a relief valve which is used to maintain a minimum boost pressure and operates at a standard setting of 14 bar (other options available on request).

Different orifice sizes may be used to select varying flows of flushing fluid. The following table gives flushing rate values based on a boost/charge pressure of 25 bar.

▼ Schematic

Flushing flow rates

Flushing code	Orifice size (mm)	Flow (l/min) at 25 bar ¹⁾	
		min	max
F1	Ø1	2.2	2.7
F2	Ø1.5	5.0	6.1
F7	Ø1.7	6.4	7.8
F4	Ø2	8.2	10.7
F6	Ø2.3	8.8	11.4

1) 0.6 mm Shim (Standard), Cracking pressure = 11±3 bar

Holding brake (multi-disc brake)

Mounting

By way of rear housing (2) and brake shaft (14).

Brake application

As a safety requirement in mobile applications a parking brake may be provided to ensure that the motor cannot turn when the machine is not in use. The parking brake provides holding torque by means of discs (11) that are compressed by a disc spring (10). The brake is released when oil pressure is applied to brake port "Z" and the pressure in the annular area (9) compresses the disc spring using brake piston (12) thus allowing the brake discs (11) to turn independently.

Note

This brake is provided solely for static use - not to be used dynamically.

▼ Schematic diagrams

Manual release of holding brake

The brake may also be released manually by loosening screws (13).

Speed sensor

A Hall-effect speed sensor (16) may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc (17) is fitted to the motor cylinder block (4), and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed.

Versions are available for use with regulated supplies 10 V (Code P1) and for direct connection to a 12 V or 24 V unregulated supply (Code P2).

The motor can also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These "sensor-ready" motors may be fitted with a sensor at a later date.

Direction of rotation with flow

Note

- ▶ Motor performance values are based on theoretical calculations.
- ▶ Efficiencies are not taken into consideration for theoretical calculations.
- ▶ Brake torque accounts for tolerances. Values are based when used with standard mineral oil (HLP). Please refer the related foot notes for more details.

Footer from page 7 and 8

- 1) Ensure motor case is filled with oil prior to start-up.
- 2) For installation and maintenance details, please see instruction manual 15215-B.
- 3) For use with environmentally acceptable fluids HEES, HEPG, HETG, fluoroelastomer / Viton seals must be specified.
- 4) Extension of the allowable temperature range may be possible depending on specification. Please consult Bosch Rexroth Engineering Department in Glenrothes for further details.
- 5) Maximum values should only be applied for a small portion of the duty cycle. Please consult Bosch Rexroth Engineering Department in Glenrothes for motor life calculations based on particular operating cases.

- 6) When operating motors in series, please consult Bosch Rexroth Engineering Department in Glenrothes.
- 7) For continuous operation at speeds <5 rpm please consult Bosch Rexroth Engineering Department in Glenrothes.
- 8) Based on nominal no-load Δp of 20 bar in full-displacement mode.
- 9) Warning! During the running in period of the motor (min. 20 hrs) it should not be run unloaded at >100 rpm.
- 10) Guide values for up to 5000 hours of motor operation (ISO VG46 at 50 °C).

Radial piston motor for hydraulic drive assist

MCR-R

Series 41

- ▶ Frame size MCR 10
- ▶ Displacement 780cc and 1120cc
- ▶ Differential pressure up to 450 bar
- ▶ Torque output up to 6420 Nm
- ▶ Drive speed up to 215 rpm
- ▶ Freewheel speed up to 600 rpm
- ▶ Open and closed circuits

Features

- ▶ Compact robust construction
- ▶ Rotating case design
- ▶ High volumetric and mechanical efficiencies
- ▶ High pressure rating
- ▶ High reliability
- ▶ Low maintenance
- ▶ Smooth running at very low speeds
- ▶ Low noise
- ▶ Integrated flushing in drive and freewheel

Technical data	5
Dimensions	7
Selection guide	8

Functional description

Hydraulic motor type MCR-R is a radial piston motor with a rotating case designed for installation on a vehicle axle to provide hydraulic drive to its wheel.

Construction

Rotating assembly consisting of case (1), cam (2) and distributor (4). Cylinder block (5) containing pistons (6) fitted with magnets (7). Fixed stub axle extension (3).

Transmission

The cylinder block (5) is splined onto the vehicle's axle. The pistons (6) are arranged radially in the cylinder block (5) and make contact with the cam (2) via rollers (8). The extension of the pistons (6) acting upon the cam (2) drives the rotating assembly which is bolted to the vehicle's wheel hub.

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

Ports A, B and L are connected to galleries drilled through the vehicle axle. The galleries in the stub axle extension (C) direct the oil via the distributor (4) into the cylinder chambers (D). The L port returns leakage oil from the motor case.

Freewheeling

When not in drive mode the motor is selected to freewheel by relieving ports A and B to tank and pressurising the case via port L. This pushes the pistons back into the cylinder block and holds the rollers clear of the cam. In the event of loss of hydraulic pressure the magnets in the base of each piston (7) will hold them in the retracted position.

Motor flushing

In a closed circuit hydraulic system, the same fluid circulates between the pump and the motor. If the system was run under these conditions for any length of time the fluid would soon overheat. To address this the MCR-R has an integral flushing system which allows a controlled flow of fluid to be diverted from the system and back to tank via the system cooling arrangement.

The MCR-R includes features to enable integral flushing in both drive and freewheel modes, flushing during freewheel is of particular importance due to the higher operating speeds.

Flushing during drive

Pressure differential between **A** and **B** will cause the flushing spool (1) to shift and connect the low pressure return flow to the flushing poppet (2). If the return pressure is above a predetermined level the flushing poppet will open and allow fluid flow to tank via the motor case drain (L). The standard setting for the poppet cut off is 14 bar. This is to protect other system functions by closing off flushing flow if system return (charge) pressure drops below this value. The flushing flow rate is determined by the flushing poppet orifice (3). Different sizes of orifice are available to vary the flow depending upon system requirements.

Flushing during freewheel

During freewheel, **A** and **B** ports are connected to tank and a fluid flow is applied to the **L** port to pressurise the motor's case and push the pistons back into the cylinder block. Poppets (4) will open and permit fluid flow from the case back to tank via the **A** and **B** ports.

Note

- ▶ Motor performance values are based on theoretical calculations.
- ▶ Efficiencies are not taken into consideration for theoretical calculations.

Please refer the related foot notes for more details.

1) Ensure motor case is filled with oil prior to start-up.

2) For installation and maintenance details, please see operating manual 15215-01-B

3) Maximum values should only be applied for a small portion of the duty cycle. Please consult Rexroth Engineering, Department in Glenrothes for motor life calculations based on particular operating cases.

4) For continuous operation at speeds <5 rpm please consult Rexroth Engineering Department in Glenrothes.

5) Based on nominal no-load DP of 20 bar

6) Warning! During the running in period of the motor (min. 20 hrs) it should not be run unloaded at >100 rpm.

7) If planning to operate motors in series, please consult Rexroth Engineering Department in Glenrothes.

8) For use with environmentally acceptable fluids HEES, HEPG, HETG, fluoroelastomer / Viton seals must be specified. For further information, please refer to 90221.

9) For use with HF hydraulic fluids please refer to 90229.

10) Extension of the allowable temperature range may be possible depending on specification. Please consult Rexroth Engineering Department in Glenrothes for further details.

11) For limited time speeds up to 720 rpm may be acceptable. Please consult Rexroth Engineering at Glenrothes.

Efficiencies

Data applies after a 20 hour run in time and has been established using a typical axle bearing arrangement.

▼ **Mechanical efficiency**

▼ **Volumetric efficiency**

— 100 bar / 1450 psi
 - - - 350 bar / 5100 psi

Minimum charge pressure

Value is based on the requirement at the motor stub axle port.

▼ **Minimum charge pressure in pump mode**

For specific performance information or operating conditions contact the Engineering Department at Bosch Rexroth Glenrothes.

Functional description

Hydraulic motors of the type MCR-T are radial piston motors with front case mounting and flanged shaft. They are specially designed for track drive applications and are primarily used as drive motors on skid-steer loaders and compact track loaders.

The MCR-T type motor can be used in open as well as closed hydraulic circuits.

Construction

Two part housing (1, 2), rotary group (3, 4, 8), cam (5), drive shaft (6) and flow distributor (7)

Transmission

The cylinder block (4) is connected to the shaft (6) by means of splines. The pistons (3) are arranged radially in the cylinder block (4) and make contact with the cam (5) via rollers (8).

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

The ports **A** and **B**, which are located in the rear case, carry oil through the distributor to the cylinder chambers (**E**).

Bearings

Tapered roller bearings capable of transmitting high axial and radial forces are fitted as standard.

Freewheeling

In certain applications there may be a requirement to free-wheel the motor. This may be achieved by connecting ports **A** and **B** to zero pressure and simultaneously applying a pressure of 2 bar to the housing through port **L**. In this condition, the pistons are forced into the cylinder block which forces the rollers to loose contact with the cam thus allowing free rotation of the shaft.

Two speed operation (2W)

In mobile applications where vehicles are required to operate at high speed with low motor loads, the motor can be switched to a low-torque and high-speed mode. This is achieved by operating an integrated valve which directs hydraulic fluid to only one half of the motor while continuously re-circulating the fluid in the other half. This “reduced displacement” mode reduces the flow required for a given speed and gives the potential for cost and efficiency improvements. Maximum rated speed of the motor remains unchanged.

Bosch Rexroth has developed a special spool valve to allow smooth switching to reduced displacement whilst on the move. This is known as “soft-shift” and is a standard feature of 2W motors. The spool valve requires either an additional sequence valve or electro-proportional control to operate in “soft-shift” mode. Alternatively, enhanced soft-shifting via software control primarily for Compact Track Loader applications is now available from Bosch Rexroth.

▼ Two-speed motor

Note

2W can not be used in open circuit.

Flushing valve

In a closed circuit, the same hydraulic fluid continuously flows between the pump and the motor. This could therefore lead to overheating of the hydraulic fluid. The function of the flushing valve option is to replace hydraulic fluid in the closed circuit with that from the reservoir. When the hydraulic motor is operated under load, either in the clockwise or counter-clockwise direction, the flushing valve opens and allows a fixed flow of fluid through an orifice from the low pressure side of the circuit. This flow is then fed to the motor housing and back to the reservoir normally via a cooler. In order to charge the low pressure side of the circuit, cold fluid is drawn from the reservoir by the boost pump and is fed to the pump inlet through the check valve. Thus the flushing valve ensures a continuous renewal and cooling of the hydraulic fluid. The flushing feature incorporates a relief valve which is used to maintain a minimum boost pressure and operates at a standard setting of 14 bar (other options available on request). Different orifice sizes may be used to select varying flows of flushing fluid. The following table gives flushing rate values based on a boost / charge pressure of 25 bar.

▼ Motor with flushing valve

Flushing flow rates

Flushing code	Orifice size (mm)	Flow (l/min) at 25 bar ¹⁾	
		min	max
F1	Ø1	2.2	2.7
F2	Ø1.5	5.0	6.1
F7	Ø1.7	6.4	7.8
F4	Ø2	8.2	10.7
F6	Ø2.3	8.8	11.4

1) 0.6 mm Shim (Standard), Cracking pressure = 11±3 bar

Holding brake (multi-disc brake)

Mounting

The MCR T-type motor has a spring applied pressure released holding brake integrated into the front of the motor.

Brake application

As a safety requirement in mobile applications a parking brake is provided to ensure that the motor cannot turn when the machine is not in use. The parking brake provides holding torque by means of discs that are compressed by a disc spring. The brake is released when oil pressure is applied to brake port “Z” and the pressure in the annular area compresses the disc spring allowing the brake discs to turn independently.

Note

This brake is provided solely for static use - not to be used dynamically.

▼ Schematic diagrams

Speed sensor

A Hall-effect speed sensor (**16**) may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc (**17**) is fitted to the motor cylinder block (**4**), and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed.

Versions are available for use with regulated supplies 10 V (Code P1) and for direct connection to a 12 V or 24 V unregulated supply (Code P2).

The motor can also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These “sensor-ready” motors may be fitted with a sensor at a later date.

- 1) Ensure motor case is filled with oil prior to start-up.
- 2) For installation and maintenance details, please see operating manual 15215-B.
- 3) Other displacements and ratios contact Bosch Rexroth.
- 4) For use with environmentally acceptable fluids HEES, HEPG, HETG, fluoroelastomer / Viton seals must be specified.
- 5) Extension of the allowable temperature range may be possible depending on specification. Please consult Bosch Rexroth Engineering Department in Glenrothes for further Details.
- 6) Maximum values should only be applied for a small portion of the duty cycle. Please consult Bosch Rexroth Engineering Department in Glenrothes for motor life calculations based on particular operating cases.
- 7) When operating motors in series, please consult Bosch Rexroth Engineering Department in Glenrothes.
- 8) For continuous operation at speeds <5 rpm please consult Bosch Rexroth Engineering Department in Glenrothes.
- 9) Based on nominal no-load Δp of 20 bar in full-displacement mode.

10) Warning! During the running in period of the motor (min. 20 hrs) it should not be run unloaded at >100 rpm.

11) Guide values for up to 5000 hours of motor operation (ISO VG46 and 50°).

12) Low displacement = 450 bar, high displacement = 400 bar

13) At 0 bar case pressure, the quoted brake release pressure is over and above any case pressure present.

Note

- ▶ Motor performance values all based on theoretical calculations.
- ▶ Efficiencies not taken into consideration for theoretical calculations.
- ▶ Brake torque accounts for tolerances. Please refer the related foot notes for more details.

Radial piston motor for heavy duty wheel drives

MCR-W

- ▶ Frame size MCR3, MCR5, MCR10
- ▶ Displacement 160 cc to 1340 cc
- ▶ Differential pressure up to 450 bar
- ▶ Torque output up to 8530 Nm
- ▶ Speed up to 875 rpm
- ▶ Open and closed circuits

Features

- ▶ Compact robust construction
- ▶ High volumetric and mechanical efficiencies
- ▶ Rear case mount
- ▶ Wheel flange with wheel studs
- ▶ High reliability
- ▶ Low maintenance
- ▶ Smooth running at very low speeds
- ▶ Low noise
- ▶ Bi-directional
- ▶ Sealed tapered roller bearings
- ▶ High radial forces permitted on drive shaft
- ▶ Freewheeling possible
- ▶ Available with:
 - Holding brake (multi-disc), dynamic (drum) brake or Dynamic (disc) brake
 - Bi-directional two speed
 - Integrated flushing valve
 - Speed sensor

Functional description

Hydraulic motors of the type MCR-W are radial piston motors with rear case mounting and wheel flange shaft. The MCR-W motors are intended for wheel drives in open or closed circuits. They are specially designed to withstand the most demanding conditions in different applications such as; Fork lift trucks, agricultural and forestry machines. Fitted with stronger shaft and bearings, the MCR-W provides 60 percent increase in radial load capacity compared to standard radial piston motors. The integrated wheel flange with studs allows easy installation of standard wheel rims.

Construction

Two part housing (1, 2), rotary group (3, 4, 8), cam (5), drive shaft (6) and flow distributor (7)

Transmission

The cylinder block (4) is connected to the shaft (6) by means of splines. The pistons (3) are arranged radially in the cylinder block (4) and make contact with the cam (5) via rollers (8).

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

The ports A and B, which are located in the rear case, carry oil through the distributor to the cylinder chambers (E).

Bearings

Tapered roller bearings capable of transmitting high axial and radial forces are fitted as standard.

Freewheeling

In certain applications there may be a requirement to free-wheel the motor. This may be achieved by connecting ports A and B to zero pressure and simultaneously applying a pressure of 2 bar to the housing through port L. In this condition, the pistons are forced into the cylinder block which forces the rollers to lose contact with the cam thus allowing free rotation of the shaft.

Two speed operation (2W)

In mobile applications where vehicles are required to operate at high speed with low motor loads, the motor can be switched to a low-torque and high-speed mode. This is achieved by operating an integrated valve which directs hydraulic fluid to only one half of the motor's rotary group. This "reduced displacement" mode reduces the flow required for a given speed and gives the potential for cost and efficiency improvements. The motor maximum speed remains unchanged.

Bosch Rexroth has developed a special spool valve to allow smooth switching to reduced displacement whilst on the move. This is known as "soft-shift" and is a standard feature of 2W motors. The spool valve requires either an additional sequence valve or electro-proportional control to operate in "soft-shift" mode.

▼ Schematic

Flushing valve

In a closed circuit, the same hydraulic fluid continuously flows between the pump and the motor. This could therefore lead to overheating of the hydraulic fluid.

The function of the flushing valve option is to replace hydraulic fluid in the closed circuit with that from the reservoir. When the hydraulic motor is operated under load, either in the clockwise or anti-clockwise direction, the flushing valve opens and takes a fixed flow of fluid through an orifice from the low pressure side of the circuit. This flow is then fed to the motor housing and back to the reservoir normally via a cooler. In order to charge the low pressure side of the circuit, cool fluid is drawn from the reservoir and is fed to the pump inlet. Thus the flushing valve ensures a continuous renewal and cooling of the hydraulic fluid. The flushing feature incorporates a relief valve which is used to maintain a minimum boost pressure (options available, see data sheet 15225-01).

Different orifice sizes may be used to adjust the flushing flow to the application's requirements. See data sheet 15225-01 for more details and available options.

▼ Schematic

Holding brake (multi-disc brake)

Mounting

By way of rear housing (2) and brake shaft (14).

Brake application

As a safety requirement in mobile applications a parking brake may be provided to ensure that the motor cannot turn when the machine is not in use. The parking brake provides holding torque by means of discs (11) that are compressed by a disc spring (10). The brake is released when oil pressure is applied to brake port "Z" and the pressure in the annular area (9) compresses the disc spring using brake piston (12) thus allowing the brake discs (11) to turn independently.

Note

This brake is provided solely for static use - not to be used dynamically.

▼ Schematic diagrams

Manual release of holding brake

The brake may also be released manually by loosening screws (13).

Dynamic brake

Where mechanical dynamic braking is required, a drum brake or disc brake may be specified.

Drum brake

The drum brake is mounted directly onto the drive shaft (6) and front housing (1). Braking torque is provided by brake shoes acting on the inside of the drum. For dynamic braking the shoes are operated by a hydraulic cylinder, the shoes can also be operated mechanically by a cable to provide a static parking brake function.

Caliper disc brake

In applications where a more responsive dynamic brake is required a Caliper Disc Brake may be specified. The disc is mounted directly onto the shaft flange (6), the caliper is mounted on the motor front case via a caliper mounting bracket (1). Braking torque is provided by caliper acting on the disc. Other advantages of the Caliper Disc brake include greater reliability, faster response and less maintenance.

Speed sensor

A Hall-effect speed sensor (**16**) may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc (**17**) is fitted to the motor cylinder block (**4**), and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed.

Versions are available for use with regulated supplies 10 V (Code P1) and for direct connection to a 12 V unregulated supply (Code P2).

The motor can also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These “sensor-ready” motors may be fitted with a sensor at a later date.

Direction of shaft rotation with flow

Radial piston motor for slew drives

MCR-X

- ▶ Frame size MCR3, MCR5
- ▶ Displacement 160cc to 820cc
- ▶ Maximum pressure 350 bar
- ▶ Torque output up to 4000 Nm
- ▶ Open circuits

Features

- ▶ Low-speed radial-piston design
- ▶ Short installation length
- ▶ Industry-standard mounting
- ▶ Integrated pinion
- ▶ High volumetric and mechanical efficiency
- ▶ Smooth operation at very low speed
- ▶ Low noise and backlash
- ▶ Anti-shock cross-port relief valves
- ▶ Anti-cavitation valves
- ▶ Holding brake
- ▶ Optional brake release valve with delay function

Application	2
Functional description	2
Ordering code	4
Technical data	6
Dimensions	8
Selection guide	10

Application

The MCR-X motors are intended for open-circuit operation as drive motors for the slewing function primarily of excavators in the 2 to 8 ton weight range (MCR3X for 2 to 4 ton and MCR5X for 4 to 8 ton). Other possible areas of application include slewing for forestry machines and aerial work platforms.

Functional description

The MCR-X is a low-speed high-torque motor of radial-piston design. For a description of the operating principle see Bosch Rexroth data sheet 15195.

Anti-shock relief valves

Pressure relief valves venting to return line are fitted to facilitate use in open circuits. These valves have an anti-shock function to limit the rate of rise of pressure and prevent overly rapid changes in acceleration, thus limiting the shock felt by the machine operator and extending gear life. Different valve variants are used depending on the pressure.

Anti-cavitation valves

During deceleration it is necessary to maintain sufficient pressure at the motor inlet to hold the pistons against the cam ring and prevent cavitation. For this reason the motor is equipped with a make-up port M, which feeds anti-cavitation check valves connected to ports A and B (see schematic diagram on page 5). See Technical Data on page 6 for details of the pressure that is required at port M.

Holding brake

A holding brake is usually required to comply with relevant equipment standards such as EN474 and is, therefore, fitted as standard to the MCR-X motor.

A disc pack (3), with alternate discs splined to the brake shaft and brake housing (4), is compressed by the force of a disc spring (5) acting through a piston (6). The friction between the discs generates a holding torque.

When fluid is fed into the annular area (7), the pressure on the underside of the piston rises, opposing the spring force. If sufficient pressure is applied (see Technical data on page 6), the piston moves to the right, removing the compression on the disc pack and allowing the motor to turn freely.

When the pressure is removed the spring forces the piston back to the left and once again compresses the disc pack. Thus, the brake is fail-safe.

In case of hydraulic system failure, it may be manually released by loosening the end cover screws (8).

Section of holding brake

Brake valve option

The holding brake is designed to be engaged only once the motor has stopped rotating. Premature engagement can lead to noise, overheating and wear or seizure of the brake discs. Thus, there is a need to delay brake engagement after the control joystick pilot pressure falls to zero, for sufficient time to allow the machine upperstructure to come to rest in the worst case of maximum speed and maximum moment of inertia. For this reason, a brake control valve with a delay function is offered as an option on the MCR-X.

▼ **MCR-X with brake valve**

The valve functions as follows:

- ▶ The brake release pressure is fed to port Z.
- ▶ Pilot pressure from the joystick (one line for each direction) is fed to ports X1 and X2 and an internal shuttle valve feeds the higher of these to the brake control valve.
- ▶ If the pilot pressure is sufficient, the valve shifts and the brake is immediately released.
- ▶ When the joystick is returned to the centre position, pilot pressure falls, the valve shifts back and flow is drained from the brake at a metered rate determined by the diameter of an orifice within the valve. This metering of the flow out of the brake results in a delay in engagement.

Where the brake valve option is not supplied, the above functions must be implemented externally to the motor.

▼ **MCR-X without brake valve**

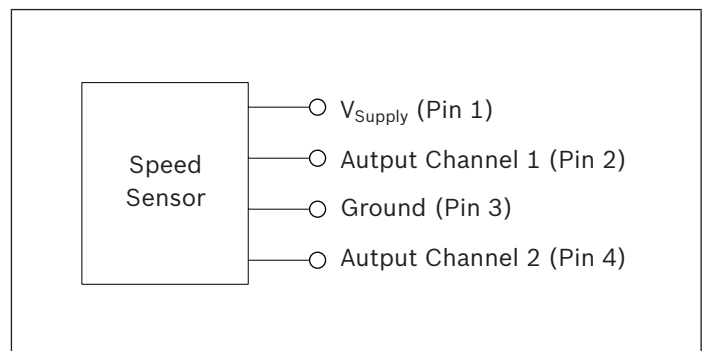

Speed sensor options

A hall-effect speed sensor may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc is fitted to the motor cylinder block, and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed. Versions are available for use with regulated supplies (Code P1) and for direct connection to a 12 V or 24 V unregulated supply (Code P2).

The MCR-X may also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These "sensor-ready" motors may be fitted with a sensor at a later date.

Terminal connections

Connector _____ Deutsch DT04-4P-E008
 Cable length _____ 600 mm
 For technical data see standard DO/100/117 (please consult Rexroth Engineering Department in Glenrothes).

Note

- ▶ Motor performance values are based on theoretical calculations.
 - ▶ Efficiencies are not taken into consideration for theoretical calculations.
 - ▶ Brake torque accounts for tolerances. Values are based when used with standard mineral oil (HLP).
- Please refer the related foot notes for more details.

- 1) The motor must be filled with oil prior to start-up. The filler port F is provided for this purpose.
- 2) For use with other fluids, please consult Rexroth Engineering Department in Glenrothes.
- 3) With high oil viscosity, there is an increased risk of cavitation, so p_M may need to be increased. The machine should be tested at the minimum operating temperature to ensure satisfactory operation.
- 4) An increase in the maximum pressure to 350 bar, and corresponding torque increase, may be possible by special order. Please consult Rexroth Engineering Department in Glenrothes for further details.
- 5) For operation below the quoted make-up pressure, please contact Rexroth Engineering Department in Glenrothes.
- 6) The quoted make-up pressure applies at the port M. Please take pressure drop in the make-up line into account. Rexroth recommends a minimum make-up line diameter of 5/8 in, but this must be confirmed by machine testing.
- 7) The quoted values are for initial reference only. Please contact Rexroth Engineering Department in Glenrothes for a full technical evaluation prior to ordering.
- 8) The setting range quoted applies with standard springs. Extension of the range may be possible by special order.
- 9) The standard orifice diameter is quoted, along with the delay time for ISO VG46 oil at 50 °C. However, the orifice diameter must be selected to ensure that the brake does not apply before the motor has stopped rotating. Please contact Rexroth Engineering Department in Glenrothes for further information.
- 10) The holding brake must be applied only in the static condition. Application of the brake while the motor is turning may result in damage to the unit and reduction in holding torque. The machine designer must ensure that an adequate brake delay exists to prevent this. The brake is, however, applied with a noise-reduction coating, to prevent brake squeal during short-duration drive-through caused by swing ram operation.

Radial piston motors for industrial applications

MCR-D

MCR-E

MCR-D

- ▶ Frame size MCR3, MCR5, MCR10
- ▶ Displacement 160 cc to 1340 cc
- ▶ Differential pressure up to 450 bar
- ▶ Torque output up to 8530 Nm
- ▶ Speed up to 875 rpm
- ▶ Open and closed circuits

MCR-E

- ▶ Frame size MCR5
- ▶ Displacement 380 cc to 820 cc
- ▶ Differential pressure up to 450 bar
- ▶ Torque output up to 5220 Nm
- ▶ Speed up to 570 rpm
- ▶ Open and closed circuits

Features

- ▶ Compact robust construction
- ▶ High volumetric and mechanical efficiencies
- ▶ Front case mount
- ▶ Parallel shaft with key
- ▶ High reliability
- ▶ Low maintenance
- ▶ Smooth running at very low speeds
- ▶ Low noise
- ▶ Bi-directional
- ▶ Sealed tapered roller bearings
- ▶ Freewheeling possible
- ▶ Available with:
 - Holding brake (multi-disc)
 - Bi-directional two speed
 - Integrated flushing valve
 - Speed sensor

Functional description

Hydraulic motors of the type MCR-D, MCR-E are radial piston motors with front case mounting and parallel shaft with key. MCR-D and MCR-E have the same type of rotary group and rear case assembly but differ in the front case mounting. These motors are intended for open or closed circuit operations as drive motors for various industrial applications.

Construction

Two part housing (1, 2), rotary group (3, 4, 8), cam (5), drive shaft (6) and flow distributor (7)

Transmission

The cylinder block (4) is connected to the shaft (6) by means of splines. The pistons (3) are arranged radially in the cylinder block (4) and make contact with the cam (5) via rollers (8).

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

The ports A and B, which are located in the rear case, carry oil through the distributor to the cylinder chambers (E).

Bearings

Tapered roller bearings capable of transmitting high axial and radial forces are fitted as standard.

Freewheeling

In certain applications there may be a requirement to free-wheel the motor. This may be achieved by connecting ports A and B to zero pressure and simultaneously applying a pressure of 2 bar to the housing through port L. In this condition, the pistons are forced into the cylinder block which forces the rollers to lose contact with the cam thus allowing free rotation of the shaft.

Two speed operation (2W)

In mobile applications where vehicles are required to operate at high speed with low motor loads, the motor can be switched to a low-torque and high-speed mode. This is achieved by operating an integrated valve which directs hydraulic fluid to only one half of the motor while continuously re-circulating the fluid in the other half. This “reduced displacement” mode reduces the flow required for a given speed and gives the potential for cost and efficiency improvements. The motor maximum speed remains unchanged.

Bosch Rexroth has developed a special spool valve to allow smooth switching to reduced displacement whilst on the move. This is known as “soft-shift” and is a standard feature of 2W motors. The spool valve requires either an additional sequence valve or electro-proportional control to operate in “soft-shift” mode.

▼ Schematic

Flushing valve

In a closed circuit, the same hydraulic fluid continuously flows between the pump and the motor. This could therefore lead to overheating of the hydraulic fluid.

The function of the flushing valve option is to replace hydraulic fluid in the closed circuit with that from the reservoir. When the hydraulic motor is operated under load, either in the clockwise or anti-clockwise direction, the flushing valve opens and takes a fixed flow of fluid through an orifice from the low pressure side of the circuit. This flow is then fed to the motor housing and back to the reservoir normally via a cooler. In order to charge the low pressure side of the circuit, cool fluid is drawn from the reservoir by the boost pump and is fed to the pump inlet through the check valve. Thus the flushing valve ensures a continuous renewal and cooling of the hydraulic fluid. The flushing feature incorporates a relief valve which is used to maintain a minimum boost pressure and operates at a standard setting of 14 bar (other options available on request).

Different orifice sizes may be used to select varying flows of flushing fluid. The following table gives flushing rate values based on a boost / charge pressure of 25 bar.

▼ Schematic

Flushing flow rates

Flushing code	Orifice size (mm)	Flow (l/min) at 25 bar ¹⁾	
		min	max
F1	Ø1	2.2	2.7
F2	Ø1.5	5.0	6.1
F7	Ø1.7	6.4	7.8
F4	Ø2	8.2	10.7
F6	Ø2.3	8.8	11.4

1) 0.6 mm Shim (Standard), Cracking pressure = 11±3 bar

Holding brake (multi-disc brake)

Mounting

By way of rear housing (2) and brake shaft (14).

Brake application

As a safety requirement in mobile applications a parking brake may be provided to ensure that the motor cannot turn when the machine is not in use. The parking brake provides holding torque by means of discs (11) that are compressed by a disc spring (10). The brake is released when oil pressure is applied to brake port “Z” and the pressure in the annular area (9) compresses the disc spring using brake piston (12) thus allowing the brake discs (11) to turn independently.

Note

This brake is provided solely for static use - not to be used dynamically.

Schematic diagrams

Manual release of holding brake

The brake may also be released manually by loosening screws (13).

Speed sensor

A Hall-effect speed sensor (16) may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc (17) is fitted to the motor cylinder block (4), and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed.

Versions are available for use with regulated supplies 10 V (Code P1) and for direct connection to a 12 V or 24 V unregulated supply (Code P2).

The motor can also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These “sensor-ready” motors may be fitted with a sensor at a later date.

Direction of shaft rotation with flow

Footer from page 7

- 1) Not available for E-Type
- 2) Ensure motor case is filled with oil prior to start-up. See instruction manual 15215-B.
- 3) For installation and maintenance details, please see instruction manual 15215-B.
- 4) For use with environmentally acceptable fluids HEES, HEPG, HETG, fluoroelastomer / Viton seals must be specified.
- 5) Extension of the allowable temperature range may be possible depending on specification. Please consult Bosch Rexroth Engineering Department in Glenrothes for further details.
- 6) Maximum values should only be applied for a small portion of the duty cycle. Please consult Bosch Rexroth Engineering Department in Glenrothes for motor life calculations based on particular operating cases.
- 7) When operating motors in series, please consult Bosch Rexroth Engineering Department in Glenrothes.
- 8) For continuous operation at speeds <5 rpm please consult Bosch Rexroth Engineering Department in Glenrothes.
- 9) Based on nominal no-load Δp of 20 bar in full-displacement mode.
- 10) Warning! During the running in period of the motor (min. 20 hrs) it should not be run unloaded at >100 rpm.
- 11) Guide values for up to 5000 hours of motor operation (ISO VG46 at 50 °C).
- 12) Maximum pressure is restricted according to maximum torque

Note

- ▶ Motor performance values are based on theoretical calculations.
 - ▶ Efficiencies are not taken into consideration for theoretical calculations.
 - ▶ Brake torque accounts for tolerances. Values are based when used with standard mineral oil (HLP).
- Please refer the related foot notes for more details.

Gears

Planetary gear units for mobile applications

Designation	Output torque	Data sheet	Page
Hydrostatic drives HYDROTRAC GFT	9...450 kNm	77110	869
Compact hydrostatic drives HYDROTRAC GFT 45 T2/T3	45 kNm	77115	889
Drive unit for crawler track equipment, series 2000 – HYDROTRAC GFT	13,5...42,5 kNm	77116	893
Planetary gearboxes for mobile applications HYDROTRAC GFT 8000 Series 40	10...130 kNm	77117	895
Planetary gearboxes for mobile applications HYDROTRAC GFT 8130 / 8140 Series 30	20...30 kNm	77128	899
Swing drives MOBILEX GFB	4...6,83 kNm	77201	903
Drive unit for revolving superstructures, series 2000 – MOBILEX GFB	4...14,5 kNm	77206	919
Winch drives MOBILEX GFT-W	14...325 kNm	77502	921

Hydrostatic drives HYDROTRAC GFT for mobile applications

- ▶ Sizes GFT 9 to GFT 450
- ▶ Output torques from 9000 to 450000 Nm

Features

- ▶ Compact, space-saving planetary gearbox design
- ▶ Planet wheels carried in full-complement bearings
- ▶ Robust main bearing system
- ▶ Simple mounting
- ▶ Easy oil change
- ▶ Integrated static multiple disk brake
- ▶ Low-noise running operation

Contents

Dimensions and technical data	
for output torques from:	
9000 Nm to 36000 Nm	4
40000 Nm to 110000 Nm	6
160000 Nm to 450000 Nm	8
Customer specification wheel application	10
Customer specification chain application	13
Customer specification drum application	16

Description

Rexroth compact hydrostatic HYDROTRAC GFT drives are the ideal driving components for wheel or track-laying vehicles and other mobile equipment. They are the perfect choice for every conceivable moving or turning application.

The drives are extremely compact and thus may also be installed in space-critical mounting configurations. The drives' load capacity and availability is extraordinary thanks to the use of case-hardened annulus gears.

Three-stage compact hydrostatic drive
Rexroth HYDROTRAC GFT with multiplate parking
device and Rexroth plug-type motor

The gear teeth design reflects both standard requirements and in-house operating strength calculations based on our comprehensive know-how and optimally adapted to our modern fabrication processes.

The drives feature maximum total efficiency ratings which, inter alia, is due to the use of Rexroth plug-type motors. The drives described in this bulletin are constantly reviewed and advanced. Other design variants with deviating transmission, dimensions and power characteristics are available if so requested for specific applications.

Gearbox design

Gearbox design is based on long years of experience and reflects not only the customary standard design regulations but also satisfies operational strength requirements as per DIN 3990, ISO 6336, AGMA, GL or DNV. The output torque values indicated are short-term admissible peak torques meant for excavator travel drive applications. For other applications deviating output torques differing from those specified may apply to the respective gearbox. Even in the project stage we are prepared to offer application-specific consultation to customers aimed at finding the optimum drive configuration

Hydraulic Motors

Rexroth hydraulic motors are preferably integrated in a space-saving manner as flanged-on fixed or variable displacement units plugged into the gearbox.

Spring loaded multiplate parking brake integrated

As a standard supply feature the gearbox comes with one spring-loaded hydraulically released multiplate parking brake integrated on the input side. The static multiplate parking brake system is only a parking brake. The parking brake torque will suit the respective motor torque.

Disconnecting device

If requested, some of the drive systems may also be provided with a mechanical disconnecting device so that, if time is of essence, the equipment can be towed without damaging the hydraulic system.

Sealing system

An axial mechanical seal is mounted between the stationary and rotating gearbox sections. This prevents moisture and dirt from entering the drive even under extreme operating conditions.

Oil changes

Save for regular oil changes the drives do not require maintenance. Oil changes may conveniently be made from the outside. Recommendations as to lube oils are given in the operating manual.

Design variants

Model designations 1000 - 9000 indicate basic size and design variants that are readily available to our customers. To suit specific application requirements other models can also be furnished upon request. Depending on currently furnished units and transmission ratios many drives are available on preferential terms offering favorable prices and improved delivery times. If you are interested, please let us know.

To suit the required ratio the gearboxes are of two- (T2) or three-stage (T3) design. If so requested, gear models 330 and 450 may be provided with an additional preliminary stage and in that case will be of four-stage design (T4). Please also observe our gearboxes series HYDROTRAC GFT 2000 (RE 77116) and HYDROTRAC GFT 8000 (RE 77117, RE 77128)

Hydrostatic drives HYDROTRAC GFT overview

Type/design variant GFT	Output torque $T_{2 \max}$ Nm	Gear ratio from/to i
GFT 9 T2	9000	47.6 - 55.3
GFT 13 T2	13000	22.6 - 37.6
GFT 17 T2	17000	37.6 - 54
GFT 17 T3	17000	77.9 - 88.2
GFT 24 T3	24000	90.1 - 137.2

Description, Brake / Clutch, Hydraulic Motors, Shipment, Weights, Oil Volume, Dimensions, Other Notes	2
Dimensions and Technical Data	3

Description

Two-speed travel drive HYDROTRAC GFT 45 T2/3 capable of shifting gears under load has been designed for vehicles which when performing normal work run at uniform low speed but are required to move significantly faster e.g. when traveling from one location to another.

This gear drive variant may for example be employed for blacktop paving equipment.

Gear shifting is effected by operating the two integrated clutches. As a result of the force-closed clutch design using friction plates gearshifting may also take place when the vehicle is moving.

Brake / Clutch

When the vehicle is stationary the static locking torque is applied by engaging the two clutches. This causes the preliminary gear stage to be blocked. If inverted braking is permissible through engaging the disconnected clutch a service brake function can be achieved when using appropriately sized friction plates.

Hydraulic Motors

The gearbox has been designed for the direct attachment of a variable-displacement motor (preferably Rexroth hydraulic motors). This motor will be included in the supply on request.

Delivery / Shipment

Rexroth planetary gear units of type HYDROTRAC are shipped ready for mounting, but without oil filling. Standard supply includes external gearbox priming paint coat of color shade grey(similar to RAL 7032).

An internal preservation protects the unit against corrosion for a period of 12 months when stored in a dry place. Surfaces of external flanges, shaft ends and attachment faces are applied with preservative e.g. PERIGOL VCI 230 or CUSTOS 10-38.

Weights, Oil Volume, Dimensions

The weights indicated are to be understood as average values. However, the oil volume must always be ascertained via the oil level monitoring device. The figures and dimensions are not strictly obligatory. We reserve the right to implement technical modifications aimed at improving our products.

Other Notes

Statutory requirements provide that all rotating components must be provided with touch guards. All safety regulations prescribed for the relevant mounting locations must be observed. Commissioning and maintenance of the gear units to be in line with the instructions provided in our operating manual.

Please also observe our gearboxes series HYDROTRAC GFT 2000 (RE 77116) und HYDROTRAC GFT 8000 (RE 77117, RE 77128).

HYDROTRAC GFT

Drive unit for crawler track equipment

Series 2000

Data sheet

Contents

Dimensions
Technical data

Page

2

Description

The hydrostatic drive unit of the GFT 2000 series consists of a two-stage planetary gearbox with an integrated hydraulic swash plate axial-piston motor. The complete unit is designed as a drive for tracked vehicles. The integrated dual displacement motor is provided with an automatic shifting function for automatic selection between $V_{g \min}$ and $V_{g \max}$. Optionally, the integrated dual displacement motor is provided with an HZ-adjustment.

- Compact, space-saving two-stage drive unit
- Suitable for crawler track equipment
- Open circuit
- Automatic shifting function
- Integrated Multiple disk brake
- Mechanical disconnect mechanism (optional)
- Connection plate with integrated brake valve and pressure relief valve
- Easy installation as a complete unit

Planetary gearboxes for mobile applications

HYDROTRAC GFT 8000

Series 40

- ▶ Sizes 8110 to 8190
- ▶ Output torques between 10000 and 130000 Nm

Features

- ▶ Compact, space-saving two- or three-stage planetary gearbox
- ▶ Robust design
- ▶ Integrated static multiple-disk parking brake
- ▶ Several sizes also with dynamic brake
- ▶ Assembly of variable plug-in and fixed displacement plug-in motors different series possible
- ▶ For open and closed circuits
- ▶ Easy assembly
- ▶ Disconnect mechanism (optional)
- ▶ Wheel studs (optional)

Description	2
Technical data	2
Application conditions	2
Dimensions	3
Planetary gearboxes for mobile units	4

Description

The hydrostatic compact drive series 40 consists of a two- or three-stage planetary gearbox, which - in combination with a hydraulic axial piston motor - builds a space-saving drive unit. The complete unit is used as a drive component for wheel- or chain driven vehicles and other mobile applications.

Application conditions

The planetary gearboxes are designed for use in environmental temperatures between -25°C and +40°C. Environmental factors such as salt water, salt air, sand, dust, pressure, severe shocks, extreme shock loads and environmental temperatures, aggressive media, etc. affect the function. Such influences must be pre-announced in order for a secure gearbox design.

Planetary gearboxes for mobile applications

HYDROTRAC GFT 8130 / 8140

Series 30

- ▶ Sizes 8130 and 8140
- ▶ Output torques between 20000 and 30000 Nm

Features

- ▶ Compact, space-saving two- or three-stage planetary gearbox
- ▶ Robust design
- ▶ Integrated static multiple-disk parking brake
- ▶ Assembly of variable plug-in and fixed displacement plug-in motors different series possible
- ▶ For open and closed circuits
- ▶ Easy assembly
- ▶ Disconnect mechanism (optional)
- ▶ Wheel studs (optional)

Planetary gearboxes for mobile units	4

Description

The hydrostatic compact drive series 40 consists of a two- or three-stage planetary gearbox, which - in combination with a hydraulic axial piston motor - builds a space-saving drive unit. The complete unit is used as a drive component for wheel- or chain driven vehicles and other mobile applications.

Application conditions

The planetary gearboxes are designed for use in environmental temperatures between -25°C and +40°C. Environmental factors such as salt water, salt air, sand, dust, pressure, severe shocks, extreme shock loads and environmental temperatures, aggressive media, etc. affect the function. Such influences must be pre-announced in order for a secure gearbox design.

Description

Rexroth MOBILEX GFB planetary gearboxes are hydrostatic swing gears.

They are suitable for use in excavators and cranes of all types, in ship unloading equipment, forestry equipment and in all applications where accurate positioning is called for.

The drive consists of a two- or three-stage gearbox with an integrated multi-disk parking brake, an output pinion as well as a hydraulic motor, preferably from Rexroth.

The information provided in this bulletin serves to help you select the planetary gearbox best suited for your application. In addition, our field personnel are available to you to provide advisory services even at the project stage.

Rexroth MOBILEX GFB two-stage hydrostatic compact drive with a multiplate parking device and a Rexroth plug-in motor

Lubrication

The gear teeth and bearings are splash lubricated. Aside from periodic oil changes, the drive units are maintenance-free. Oil changes are easy to do. The oil brands recommended in the operating manual shall be exclusively used. The change intervals for the relevant application conditions are also given in the operating manual. The pinion-side antifriction bearing of the output shaft is grease-lubricated for life.

Hydraulic Motors

The gearbox is designed for direct flange attachment of a variable or fixed displacement motor (preferably a Rexroth hydraulic motor).

Multiplate Parking Device

The standard supply scope includes a spring-loaded, hydraulically released multiplate parking device arranged on the input side.

The multiplate parking device is not a service brake.

Gearbox Supply

Rexroth MOBILEX planetary gearboxes are delivered ready for installation, but without oil filling. The standard gearbox version comes with a priming coat of gray color (similar to RAL 7032) and is internally protected with a temporary corrosion preventive that preserves the gearbox for 12 months, if stored in a dry location.

External flanges, shaft extensions and mating faces are protected with e.g. PERIGOL VCI 230 or CUSTOS 10-38

Mass, Oil Volumes, Dimensions

The specified mass are average figures.

As far as oil volumes are concerned, gearbox operators should rely on oil level readings rather than specified oil volumes. Figures and dimensions are not strictly binding. We reserve the right to make changes in line with technical progress.

Further Notes

As prescribed by stationary provisions, all rotating parts must be protected by guards against accidental contact. Local safety regulations must be complied with. Commissioning and maintenance of the gearboxes must be performed in line with the instructions given in our operating manual.

Please also note our gearbox series MOBILEX GFB 2000 (RE 77206).

Swing Drives MOBILEX GFB - Overview

Type/Version GFB	Output Torque		Gear Ratio from/to <i>i</i>
	Excavator $T_{2 \max}$ Nm	Crane $T_{2 \max}$ Nm	
GFB 9 T2	4,000	7,000	33.4
GFB 17 T2	7,700	12,700	32.5 - 45.7
GFB 24 T2	10,600	17,500	149.1
GFB 26 T3	10,000	16,500	43.9 - 51.5
GFB 36 T3	17,500	28,500	117.6 - 153.6
GFB 50 T2	22,000	38,000	32.3
GFB 50 T2	22,000	38,000	147.4
GFB 80 T3	38,200	68,300	186.4
GFB 84 T2	38,200	68,300	35.1

Application Conditions

The gearboxes are designed for use at ambient temperatures of between -20°C and +40°C. Environmental influences such as salt water, salty air, sand, dust, compressure, heavy vibrations, extreme shocks and ambient temperatures, aggressive fluids and the like may affect the function so that the gearbox can be designed for safe operation.

Gearbox Design

The gearbox design is based on many years of practical application experience. The maximum output torques $T_{2\ max}$ indicated under technical data for crane applications relate to FEM Section I, 3rd Edition and Section IX (FEM - Fédération Européene de la Manutention), as well as DIN 15020, collective load class L2, service and time category T5 corresponding to driver group M5. The reference output speed is 25 revolutions per minute maximum. If the swing drive is to be classified in another driver group, the required output torque must be converted using the K factor (see table). This conversion gives you the maximum admissible output torque for the new driver group selected. Whether or not the chosen overall classification can be met will be determined by the Rexroth gear technology experts

Higher Torques

For gearboxes transmitting higher torques than those indicated in this product catalog, please contact us.

Gearbox Selection

- ▶ T_2 = Output torque
- ▶ T_{2K} = Corrected output torque
K factor according to device time category and collective group given in the table.
$$T_{2K} = T_2 \cdot K$$
- ▶ T_{2K} of the gearbox to be selected must be $\leq T_{2\ max}$ (according to this product catalog).

Multiplate Parking Device

$$T_{Br\ sta.\ min} = 1,3 \cdot T_2 \text{ (input torque)}$$

The holding torque multiplies with the selected transmission ratio.

See also Gearbox Design.

The customer specification for swing drives is reproduced on pages 10 to 12.

Driver Groups and Service Time Categories FEM, Section I, 3rd Edition 1987 (FEM: Fédération Européene de la Manutention)

Description

The hydrostatic drive unit of the GFB 2000 series consists of a two-stage planetary gearbox with an attached hydraulic swash plate slew drive motor. This compact drive is designed for swiveling a revolving superstructure of a crawler or wheel excavators. The slew drive motor is provided with an integrated static multiple disk brake and a vibration damping valve.

- Compact, space-saving two-stage drive unit
- Multiple disk brake integrated into the motor
- Built-on brake release valve
- Standard configuration with a vibration damping valve
- Good anti-cavitation method
- Compact design by integrated valves
- Easy installation as a complete unit
- Open circuit

Winch drives MOBILEX GFT-W for mobile applications

- ▶ Sizes GFT 17 W to GFT 450 W
- ▶ Output torques between 14 and 325 kNm
- ▶ Rope pull forces from 67 to 684 kN

Features

- ▶ Compact, space-saving planetary gearbox design
- ▶ Planet wheel carried in full-complement bearings
- ▶ Robust bearing system absorbing the forces exerted by the rope pull
- ▶ Easy assembly
- ▶ Easy oil change
- ▶ Integrated static multiple-disk parking brake
- ▶ Low-noise operation

Functional description

Description

The hydrostatic Rexroth winch drives MOBILEX GFT-W are the ideal drive components for winches. They have proven their worth in the most arduous applications and under tough operating conditions. MOBILEX GFT-W winch drives are used in all kinds of winches - mobile and crawler cranes, railroad cranes, shipboard, dockside and container cranes. Due to their extremely compact design, the gear units can be mounted inside the rope drum in a space-saving manner. They are designed for ease of installation and maintenance. High-quality manufacturing processes and the use of case-hardened gearwheels as well as quenched, tempered and surface-hardened ring gears warrant outstanding load-carrying capacity, operational safety and low-noise running characteristics.

The teeth of the gearwheels are designed according to standard specifications and our own strength calculations, which have been developed based on our comprehensive know-how and are optimally adapted to our manufacturing processes. The drives provide optimum total efficiency due to the use of Rexroth hydraulic motors, among other things

Three-stage hydrostatic Rexroth winch drive MOBILEX GFT-W with static spring pressure multiple-disk parking brake and connection for Rexroth hydraulic motor

Lubrication

The gears and bearings are splash-lubricated. The drive units are maintenance-free save for periodic oil changes, which are convenient to make. Only the oils specified in the operating manual should be used in the gearboxes. The change intervals for different operating conditions are also specified in the operating manual.

Spring pressure multiple-disk parking brake

In the standard version, one spring-loaded, hydraulic release spring pressure multiple-disk parking brake is installed on the drive end.

$$T_{Br. sta. min} = 1,6 \cdot T_1 \text{ (Input torque)}$$

The spring pressure multiple-disk parking brake is not a service brake, but a static parking brake, which must not be used for braking the load.

The device engineer/operator must provide a separate service or emergency brake if necessary.

The holding torque is multiplied according to the selected transmission.

Hydraulic motors

The gearbox is designed for direct flange-attachment of a variable or fixed-displacement motor (preferably a Rexroth hydraulic motor).

Version, overview

Explanation version

- 2000 = Oil inlet, oil outlet, oil level on the gear cover
 4000 = Oil inlet, oil outlet, motor-side oil level
 6000 = Oil inlet, oil outlet, motor-side oil level
 Installation of 2 gearboxes in a hoisting drum possible
 8000 = Optional with back stop
 (built-in between gearbox and holding brake)
 9000 = Special version

Options

Upon request, the drives can be supplied with the following accessories:

Counter bearing, hoisting drum, winch frame

In addition to the standard delivery scope, the winch drives of series can also be delivered:

- with counter bearing
- with counter bearing and hoisting drum
- with counter bearing, hoisting drum and winch frame

Limit switches

Upon request, special counter bearings can be designed with a connection option for specific gear cam limit switches.

Overview of MOBILEX GFT-W Winch Drives

¹⁾ Design according to FEM L2, T5, M5

²⁾ Based on a theoretical 1st layer winding diameter D_{ws}

Design, classification

Application Conditions

The gearboxes have been designed for use at ambient temperatures of between -20°C and +40°C. Environmental influences such as salt water, safety air, sand, dust, overpressure, heavy vibrations, extreme shocks and ambient temperatures, aggressive media, etc. will affect the function of the product. Such influences must be specified to ensure that the winch drive is designed to safety meet the requirements.

Gearbox design

The gearbox design is based on many years of practical experience. The maximum output torques $T_{2\max}$ indicated under Technical Data relate to FEM Section I, 3rd issue and Section IX (FEM - Fédération Européenne de la Manutention), as well as DIN 15020, collective load class L2, service time category T5 corresponding to driver group M5. The reference output speed is 25 revolutions per minute maximum. If the winch is classified into a different driver group, the required output torque must be converted by applying factor K (see table).

This results in the maximum permissible output torque for the new classification. Whether or not the selected overall classification is feasible, will be determined by the specialists of Rexroth.

Fleet Angle

Observing the admissible fleet angle α is prerequisite for proper cable winding.

The fleet angle α should not be smaller than 0,5°, so that the rope does not ascend the drum flange and runs safely into the next layer. The fleet angle α should not be larger than 1,5°, so that the rope in the first rope layer does not get pulled against the groove and by several rope layers on the rope drum are properly wound up to the drum flanges.

Gearbox selection

- T_2 = output torque
- F = rope pull in [N]
- D_w = relevant winding diameter in [m]

$$T_2 = \frac{F \cdot D_w}{2}$$

- T_{2K} = corrected output torque
- K factor according to the service time category and collective group given in the table

$$T_{2K} = T_2 \cdot K$$

- T_{2K} of the gearbox to be selected must be $\leq T_{2\max}$ (according to the bulletin).

See also gearbox design

See page 15 for a data sheet relating to the winch drive design.

Driver Groups and Service Time Categories to FEM, section I, 3rd edition 1987

(FEM: Fédération Européenne de la Manutention)

Service time category			T2	T3	T4	T5	T6	T7	T8

Operating data / design

(all values based on the 1. rope layer)

It is mandatory to fill out all fields!

For exceptions see footnotes.

Standard scope of supply

Transmission unit

Optional scope of supply

- Counter bearing
- Rope drum ³⁾
- Winch frame

Type of device

- Hoisting winch
- Boom hoist winch
- Auxiliary winch
- Pulling winch
- Other: _____

Rating acc. to FEM section I T _____ L _____ M _____

or alternative load spectrum _____

Ambient temperature from/to _____ °C

Operating machine weight ¹⁾ _____ t

Lifting capacity, max. ¹⁾ _____ t

Rope pull (top rope layer) ²⁾ F _____ N

Rope speed (1. rope layer) ²⁾ V₁ _____ m/min

Rope speed (top rope layer) ²⁾ V₂ _____ m/min

Rope diameter d _____ mm

Type of rope groove ³⁾ grooveless DIN Lebus

Rope groove pitch ³⁾ p _____ mm

Drum lead ³⁾ right left

Number of rope layers, max. ²⁾ _____

Winding diam. (1. rope layer) ²⁾ D_{ws} _____ mm

Winding diam. (top rope layer) ²⁾ D_{wx} _____ mm

Diameter of drum flanges ³⁾ D₂ _____ mm

Length between drum flanges ³⁾ L _____ mm

Rope drum capacity _____ m

incl. 3 safety turns ³⁾ _____ m

Techn. data gearbox

Selected gearbox type GFT-W _____

Max. output torque ²⁾ T_{2 max} _____ kNm

Max. drive speed ²⁾ n₂ _____ rpm

Ratio ¹⁾ i _____

Multiple-disk parking brake yes no

Min. park. torque _____ Nm

multiple-disk parking brake _____ Nm

Release pressure, max. P_{max} _____ bar

Release pressure, min ¹⁾ P_{min} _____ bar

Top coat specific yes no

Color RAL _____

¹⁾ Optional entry

²⁾ Mandatory field T_{2 max} is not specified

³⁾ Mandatory field in case of delivery with rope drum

**You wish to receive an offer for
the winch drives MOBILEX GFT-W**

Please enclose existing drawings, diagrams,
comments and the like.

Company: _____
 Name/Dept: _____
 Place: _____
 Phone: _____
 E-mail: _____
 Date: _____

Dimensions of gearbox

- Please fill out the table with the available standard dimensions from valid “Technical data sheet“, or if possible the SAP material number of a reference gearbox.
- Please mark the deviating requirements/dimensions in the table.

Material no. reference	_____
D1	_____ mm
D2	_____ mm
D3	_____ mm
D4	No. of threads _____ pcs. _____
D5	_____ mm
D6	_____ mm
D7	_____ mm
D8	No. of threads _____ pcs. _____
L2	_____ mm

Technical basic data hydraulic motor

Hydraulic circuit open closed
 Motor type code _____
 Displacement $V_{g \text{ min}}$ _____ cm^3
 Displacement $V_{g \text{ max}}$ _____ cm^3
 Flushing valve yes no
 Speed sensor, if yes: type yes, type _____ no
 Counter balance valve yes no
 Pressure relief valve yes no
 Pressure relief valve setting _____ bar
 Working pressure Δp _____ bar
 Input flow, max. $q_{v \text{ max}}$ _____ l/min

Estimated number of transmission units per year ¹⁾ _____

Price range ¹⁾ _____

Requested ship date RSD ¹⁾ _____

Special application conditions _____

Further customer-specific requirements _____

Are there any legal requirements and/or other standards to be considered?

yes no if yes, please specify _____

¹⁾ Optional entry

**You wish to receive an offer for
the winch drives MOBILEX GFT-W**

Please enclose existing drawings, diagrams,
comments and the like..

Notes

Notes

Product range

**Planetary gearboxes for mobile units****Hydrostatic travel drives**

- HYDROTRAC GFT
For fixed- or variable-displacement motors
Output torques between 9,5 and 580 kNm
Data sheet RE 77110
- HYDROTRAC GFT 2000
Series 30
Output torques between 13,5 and 42,5 kNm
Data sheet RE 77116
- HYDROTRAC GFT 8000
Series 30
Output torques between 20 and 30 kNm
Data sheet RE 77128
- HYDROTRAC GFT 8000
Series 40
Output torques between 10 and 130 kNm
Data sheet RE 77117
- HYDROTRAC GFT 45 T2/T3
Output torques max. 45 kNm
Data sheet RE 77115

Hydrostatic swing drives

- MOBILEX GFB
For fixed- or variable-displacement motors
Output torques between 4 and 68,3 kNm
Data sheet RE 77201
- MOBILEX GFB 2000
Series 20
Output torques between 4 and 14,5 kNm
Data sheet RE 77206

Hydrostatic winch gears

- MOBILEX GFT-W
For fixed- or variable-displacement motors
Output torques between 14 and 325 kNm
Data sheet RE 77502
